

# MELSEC System Q

Programmable Logic Controllers

User's Manual

## Hardware Description

# About this manual

The texts, illustrations, diagrams and examples in this manual are provided for information purposes only. They are intended as aids to help explain the installation, operation, programming and use of the MELSEC System Q modules.

If you have any questions about the installation and operation of any of the products described in this manual please contact your local sales office or distributor (see back cover). You can find the latest information and answers to frequently asked questions on our website at [www.mitsubishi-automation.com](http://www.mitsubishi-automation.com).

MITSUBISHI ELECTRIC EUROPE B.V. reserves the right to make changes to this manual or the technical specifications of its products at any time without notice.

**User's Manual**  
**MELSEC Q Series Modules**  
**Art. No.:**

| <b>Version</b> | <b>Changes / Additions / Corrections</b>  |
|----------------|---|
| A 06/2001      | First edition   |
| B 02/2002      | Additions:<br>CPU modules: Q00JCPU, Q00CPU, Q01CPU<br>Power supply modules: Q62P and Q64P<br>Base units: Q52B and Q55B<br>Extension cable: QC05B<br>Digital input modules: QX40, QX40-S1, QX41, QX42<br>Digital output modules: QY40P, QY41P, QY42P, QY50, QY68A  |
| C 10/2003      | Additions:<br>CPU modules: Q12PHCPU and Q25PHCPU<br>Digital input modules: QX41-S1, QX42-S1, QX82 and Q82-S1<br>Memory card: Q2MEM-2MBS<br>Sections 4.3.6 and 4.4<br><br>Partial correction:<br>Sections 6.2, 10.3.1 and 11.3   |
| D 09/2004      | Additions:<br>Combined I/O modules: QH42P and QX48Y57<br>CPU module battery: Q7BAT (page 3-3, sections 5.2.1, 5.2.2, 10.3.1, 10.3.2)<br>Notes on devices FX and FY (table 4-1)<br>Footnote fig. 9-5<br><br>Partial corrections:<br>Section 4.3.4<br>Notes on troubleshooting (pages 11-12 and 11-13)<br>Error codes (section 11.2.1) added  |
| E 02/2006      | Additions:<br>CPU modules: Q12PRHCPU, Q25PRHCPU, Q06CCPU<br>Power supply modules: Q63RP and Q64RP<br>Base units: Q38RB-E and Q68RB<br><br>Partial corrections:<br>MT-series modules deleted (Overview, section 3.2.1)<br>ST-series modules addad (Overview, section 3.2.1)  |
| F 03/2011 akl  | Additions:<br>CPU modules: Universal model QCPU, Process CPUs Q02PHCPU and Q06PHCPU<br>Power supply modules: Q61P, Q61P-D, Q61SP and Q64RN<br>Base units: Q32SB, Q33SB, Q35SB, Q38DB, Q321DB, Q65WRB<br>Digital input modules: QX10-TS, QX40-TS, QX80-TS<br>Digital output modules: QY10-TS, QY40-TS, QY80-TS<br>Memory cards: Q3MEM-4MBS and Q3MEM-8MBS<br><br>Partial corrections:<br>Error code list (section 11.3)<br>Notes on troubleshooting (section 11.4.1); new section 11.4.2 |

# Safety guidelines

## For use by qualified staff only

This manual is only intended for use by properly trained and qualified electrical technicians who are fully acquainted with the relevant automation technology safety standards. All work with the hardware described, including system design, installation, configuration, maintenance, service and testing of the equipment, may only be performed by trained electrical technicians with approved qualifications who are fully acquainted with all the applicable automation technology safety standards and regulations. Any operations or modifications to the hardware and/or software of our products not specifically described in this manual may only be performed by authorised Mitsubishi Electric staff.

## Proper use of the products

The MELSEC System Q modules are only intended for the specific applications explicitly described in this manual. All parameters and settings specified in this manual must be observed. The products described have all been designed, manufactured, tested and documented in strict compliance with the relevant safety standards. Unqualified modification of the hardware or software or failure to observe the warnings on the products and in this manual may result in serious personal injury and/or damage to property. Only peripherals and expansion equipment specifically recommended and approved by MITSUBISHI ELECTRIC may be used with the programmable logic controllers of the MELSEC System Q.

All and any other uses or application of the products shall be deemed to be improper.

## Relevant safety regulations

All safety and accident prevention regulations relevant to your specific application must be observed in the system design, installation, setup, maintenance, servicing and testing of these products. The regulations listed below are particularly important in this regard.

This list does not claim to be complete; however, you are responsible for knowing and applying the regulations applicable to you in your location:

- VDE Standards

- VDE 0100  
Regulations for the erection of power installations with rated voltages below 1000 V
- VDE 0105  
Operation of power installations
- VDE 0113  
Electrical installations with electronic equipment
- VDE 0160  
Electronic equipment for use in power installations
- VDE 0550/0551  
Regulations for transformers
- VDE 0700  
Safety of electrical appliances for household use and similar applications
- VDE 0860  
Safety regulations for mains-powered electronic appliances and their accessories for household use and similar applications.

- Fire safety regulations

- Accident prevention regulation

- VBG No. 4  
Electrical systems and equipment

---

### **Safety warnings in this manual**

In this manual special warnings that are important for the proper and safe use of the products are clearly identified as follows:

#### **DANGER:**

*Personnel health and injury warnings. Failure to observe the safety warnings identified with this symbol can result in health and injury hazards for the user.*

#### **CAUTION:**

*Equipment and property damage warnings. Failure to observe the safety warnings identified with this symbol can result in damage to the equipment or other property.*

---

## General safety information and precautions

The following safety precautions are intended as a general guideline for using PLC systems together with other equipment. These precautions must always be observed in the design, installation and operation of all control systems.

### DANGER:

- *Observe all safety and accident prevention regulations applicable to your specific application. Always disconnect all power supplies before performing installation and wiring work or opening any of the assemblies, components and devices.*
- *Assemblies, components and devices must always be installed in a shockproof housing fitted with a proper cover and fuses or circuit breakers.*
- *Devices with a permanent connection to the mains power supply must be integrated in the building installations with an all-pole disconnection switch and a suitable fuse.*
- *Check power cables and lines connected to the equipment regularly for breaks and insulation damage. If cable damage is found immediately disconnect the equipment and the cables from the power supply and replace the defective cabling.*
- *Before using the equipment for the first time check that the power supply rating matches that of the local mains power.*
- *You are responsible for taking the necessary precautions to ensure that programs interrupted by brownouts and power failures can be restarted properly and safely. In particular, you must ensure that dangerous conditions cannot occur under any circumstances, even for brief periods. EMERGENCY OFF must be switched forcibly, if necessary.*
- *EMERGENCY OFF facilities conforming to EN 60204/IEC 204 and VDE 0113 must remain fully operative at all times and in all control system operating modes. The EMERGENCY OFF facility reset function must be designed so that it cannot ever cause an uncontrolled or undefined restart.*
- *You must implement both hardware and software safety precautions to prevent the possibility of undefined control system states caused by signal line cable or core breaks.*

---

# Symbols used in the manual

## Use of instructions

Instructions concerning important information are marked separately and are displayed as follows:

### NOTE

| Text of instruction

## Use of numbering in the figures

Numbering within the figures is displayed by white numbers within black circles and is explained in a table following it using the same number, e.g.:

- ①
- ②
- ③
- ④

## Use of handling instructions

Handling instructions are steps that must be carried out in their exact sequence during startup, operation, maintenance and similar operations.

They are numbered consecutively (black numbers in white circles):

- ① Text.
- ② Text.
- ③ Text.

## Use of footnotes in tables

Instructions in tables are explained in footnotes underneath the tables (in superscript). There is a footnote character at the appropriate position in the table (in superscript).

If there are several footnotes for one table then these are numbered consecutively underneath the table (black numbers in white circle, in superscript):

- ① Text
- ② Text
- ③ Text

# Contents

## 1 Introduction

## 2 Basics

|       |  |      |
|-------|--|------|
| 2.1   | Features of the MELSEC System Q .....                    | 2-1  |
| 2.2   | Specification comparison of CPU.....                     | 2-5  |
| 2.2.1 | Basic model QCPU Q00JCPU, Q00CPU, Q01CPU and Q02CPU..... | 2-5  |
| 2.2.2 | High performance model QCPU (H types) .....              | 2-6  |
| 2.2.3 | Universal model QCPU.....                                | 2-7  |
| 2.2.4 | Process CPU .....  | 2-9  |
| 2.2.5 | Redundant CPU .....                                      | 2-10 |
| 2.2.6 | Motion CPU .....   | 2-11 |
| 2.2.7 | PC CPU module .....                                      | 2-13 |
| 2.2.8 | C-Controller CPU .....                                   | 2-14 |

## 3 System configuration

|       |                                       |      |
|-------|---------------------------------------|------|
| 3.1   | Overall configuration .....           | 3-1  |
| 3.2   | Overall system .....                  | 3-6  |
| 3.2.1 | Modules of MELSEC System Q .....      | 3-6  |
| 3.2.2 | Outline of system configuration ..... | 3-19 |

## 4 CPU modules

|       |                                  |      |
|-------|----------------------------------|------|
| 4.1   | Devices .....                    | 4-1  |
| 4.1.1 | Basic model QCPU.....            | 4-1  |
| 4.1.2 | High performance model QCPU..... | 4-3  |
| 4.1.3 | Universal model QCPU.....        | 4-5  |
| 4.1.4 | Process CPU .....                | 4-13 |
| 4.1.5 | Redundant CPU .....              | 4-15 |
| 4.2   | Memory capacity .....            | 4-17 |
| 4.3   | Notes for handling .....         | 4-21 |

|       |  |      |
|-------|--|------|
| 4.4   | Part names and settings of Qn(P)(R)(H)CPUs .....                   | 4-22 |
| 4.4.1 | Part names of CPU modules .....                                    | 4-22 |
| 4.4.2 | DIP switches.....  | 4-29 |
| 4.4.3 | Transfer of a program with a programming device.....               | 4-30 |
| 4.4.4 | Latch clear operation .....  | 4-31 |
| 4.4.5 | Data transfer from memory card to standard ROM.....                | 4-31 |
| 4.5   | Part names and settings of universal CPU modules .....             | 4-32 |
| 4.5.1 | Part names of CPU modules .....                                    | 4-32 |
| 4.5.2 | Transfer of a program with a programming device.....               | 4-41 |
| 4.5.3 | Reset operation .....  | 4-42 |
| 4.5.4 | Latch clear operation .....  | 4-43 |
| 4.6   | Checking serial number and function version of the CPU module..... | 4-44 |

## 5 Memory cards and batteries

|       |   |      |
|-------|---|------|
| 5.1   | Memory card .....                               | 5-1  |
| 5.1.1 | Specifications .....                            | 5-2  |
| 5.1.2 | Handling the memory card .....                  | 5-4  |
| 5.1.3 | Installing and removing a memory card .....     | 5-5  |
| 5.1.4 | Setting the write protect switch.....           | 5-9  |
| 5.2   | Batteries.....                                  | 5-10 |
| 5.2.1 | Battery specifications .....                    | 5-10 |
| 5.2.2 | Battery installation .....                      | 5-10 |
| 5.2.3 | Battery installation into the memory card ..... | 5-12 |
| 5.2.4 | Handling instructions .....                     | 5-13 |

## 6 Input and output modules

|     |                             |     |
|-----|-----------------------------|-----|
| 6.1 | Selecting I/O modules ..... | 6-1 |
| 6.2 | Part names.....             | 6-5 |

**7 Power supply modules**

|       |   |     |
|-------|---|-----|
| 7.1   | Overview .....  | 7-1 |
| 7.2   | Selecting the power supply module .....                                 | 7-2 |
| 7.2.1 | Base unit that can be used in combination with power supply module..... | 7-2 |
| 7.2.2 | Output currents of the power supplies .....                             | 7-2 |
| 7.2.3 | Life detection power supply module Q61P-D .....                         | 7-3 |
| 7.3   | Part names.....   | 7-4 |
| 7.4   | Wiring of power supply modules .....                                    | 7-7 |

**8 Base units**

|       |   |      |
|-------|---|------|
| 8.1   | Overview .....  | 8-1  |
| 8.1.1 | Extension base units that can be combined with the main base unit ..... | 8-1  |
| 8.1.2 | Precautions on using the base units Q52B and Q55B .....                 | 8-2  |
| 8.2   | Extension cable .....   | 8-3  |
| 8.3   | Part names and settings .....   | 8-4  |
| 8.3.1 | Part names .....  | 8-4  |
| 8.3.2 | Setting the extension stage number .....                                | 8-9  |
| 8.3.3 | Connection and disconnection of extension cable .....                   | 8-11 |
| 8.4   | I/O Number assignment.....  | 8-13 |

**9 Installation**

|       |  |      |
|-------|--|------|
| 9.1   | Safety guidelines .....                                      | 9-1  |
| 9.2   | General specifications .....                                 | 9-6  |
| 9.3   | Calculating heat generation of programmable controller ..... | 9-7  |
| 9.4   | Mounting the base unit.....                                  | 9-9  |
| 9.4.1 | Direct mounting.....   | 9-11 |
| 9.4.2 | Mounting a DIN rail.....                                     | 9-13 |
| 9.5   | Installation and removal of module .....                     | 9-17 |
| 9.6   | Wiring.....  | 9-19 |
| 9.6.1 | Wiring precautions .....                                     | 9-19 |

**10 Maintenance and inspection**

|   |       |
|---|-------|
| 10.1 Daily inspection .....                                     | 10-1  |
| 10.2 Periodic inspection.....                                   | 10-2  |
| 10.3 Battery life and replacement procedure.....                | 10-3  |
| 10.3.1 Battery life.....  | 10-4  |
| 10.3.2 Replacement procedure of the CPU module battery .....    | 10-16 |
| 10.3.3 SRAM card CPU module battery replacement procedure ..... | 10-20 |
| 10.4 Resuming operation of CPU after storage.....               | 10-22 |

**11 Troubleshooting**

|  |       |
|--|-------|
| 11.1 Troubleshooting basics .....  | 11-1  |
| 11.2 Troubleshooting .....   | 11-2  |
| 11.2.1 ERR. terminal (negative logic) has turned off (opened) .....                | 11-4  |
| 11.2.2 The MODE LED does not turn on.....  | 11-6  |
| 11.2.3 When the MODE LED is flickering .....                                       | 11-7  |
| 11.2.4 When the POWER LED has turned off .....                                     | 11-8  |
| 11.2.5 When the POWER LED is flickering in orange.....                             | 11-10 |
| 11.2.6 When the POWER LED has turned on in red.....                                | 11-10 |
| 11.2.7 When the LIFE LED has turned off or turned on in red/is flickering in red   | 11-10 |
| 11.2.8 When the RUN LED has turned off .....                                       | 11-11 |
| 11.2.9 When the RUN LED is flickering.....   | 11-12 |
| 11.2.10 When the ERR. LED has turned on or is flickering .....                     | 11-12 |
| 11.2.11 When the USER LED has turned on .....                                      | 11-13 |
| 11.2.12 When the BAT.ARM LED has turned on.....                                    | 11-13 |
| 11.2.13 When the BOOT LED is flickering.....                                       | 11-13 |
| 11.2.14 When the LEDs of the output module do not turn on .....                    | 11-14 |
| 11.2.15 When output load of the output module does not turn on .....               | 11-15 |
| 11.2.16 When unable to read a program.....   | 11-16 |
| 11.2.17 When unable to write a program into the CPU module.....                    | 11-17 |
| 11.2.18 When program is rewritten unintentionally .....                            | 11-18 |
| 11.2.19 When unable to perform boot operation from the memory card.....            | 11-19 |
| 11.2.20 When "UNIT VERIFY ERR." has occurred.....                                  | 11-20 |
| 11.2.21 When "CONTROL BUS ERR." has occurred .....                                 | 11-21 |
| 11.2.22 When the CPU module does not start .....                                   | 11-22 |
| 11.2.23 When the CPU cannot communicate with<br>GX Developer/GX IEC Developer..... | 11-23 |

|        |   |        |
|--------|---|--------|
| 11.3   | Error code list . . . . .                 | 11-25  |
| 11.3.1 | Error code list (1000 to 1999) . . . . .  | 11-26  |
| 11.3.2 | Error code list (2000 to 2999) . . . . .  | 11-37  |
| 11.3.3 | Error code list (3000 to 3999) . . . . .  | 11-54  |
| 11.3.4 | Error code list (4000 to 4999) . . . . .  | 11-69  |
| 11.3.5 | Error code list (5000 to 5999) . . . . .  | 11-83  |
| 11.3.6 | Error code list (6000 to 6999) . . . . .  | 11-85  |
| 11.3.7 | Error code list (7000 to 10000) . . . . . | 11-93  |
| 11.4   | I/O circuit troubleshooting . . . . .     | 11-97  |
| 11.4.1 | Input circuit troubleshooting . . . . .   | 11-97  |
| 11.4.2 | Output circuit troubleshooting . . . . .  | 11-100 |

## 12 Specifications

|         |  |       |
|---------|--|-------|
| 12.1    | General specifications . . . . .                     | 12-1  |
| 12.2    | Hardware specifications of the CPU modules . . . . . | 12-2  |
| 12.2.1  | Basic model QCPU . . . . .                           | 12-2  |
| 12.2.2  | High performance model QCPU . . . . .                | 12-3  |
| 12.2.3  | Universal model QCPU . . . . .                       | 12-4  |
| 12.2.4  | Process CPU . . . . .                                | 12-6  |
| 12.2.5  | Redundant CPU . . . . .                              | 12-7  |
| 12.3    | Input/output module specifications . . . . .         | 12-8  |
| 12.3.1  | Digital input module QX10 . . . . .                  | 12-8  |
| 12.3.2  | Digital input module QX10-TS . . . . .               | 12-9  |
| 12.3.3  | Digital input module QX28 . . . . .                  | 12-10 |
| 12.3.4  | Digital input module QX40 . . . . .                  | 12-11 |
| 12.3.5  | Digital input module QX40-TS . . . . .               | 12-12 |
| 12.3.6  | Digital input module QX40-S1 . . . . .               | 12-13 |
| 12.3.7  | Digital input module QX41 . . . . .                  | 12-14 |
| 12.3.8  | Digital input module QX41-S1 . . . . .               | 12-15 |

# 1 Introduction

This manual describes the following modules and units of the MELSEC System Q:

- CPU modules (→ Chapter 4),
- Memory cards (→ Chapter 5),
- Input and output modules (→ Chapter 6),
- Power supply modules (→ Chapter 7) and
- Base units (→ Chapter 8).

The manual comprises also detailed descriptions of:

- Installation (→ Chapter 9),
- Maintenance and Inspection (→ Chapter 10) and
- Troubleshooting (→ Chapter 11).

The MELSEC System Q is user-friendly and offers a wide range of communications facilities.

## NOTES

- For further information about programming of the programmable logic controllers refer to the programming manual of MELSEC System Q and MELSEC A/Q series (Art. No. 87432).
- For further information about application and operating of intelligent function function modules of MELSEC System Q refer to the User's Manual of the modules.

Chapter 3 of this manual describes examples, when using the CPU in independant systems. The CPU can also be used in other system configurations (Data-Link systems or Computer-Link systems). These systems are described in different manuals.

## 2 Basics

### 2.1 Features of the MELSEC System Q

#### CPU modules

The MELSEC System Q offers a wide range of CPU modules:

- Basic model QCPU
  - Q00JCPU – Q00CPU
  - Q01CPU
- High performance model QCPU
  - Q02CPU – Q02HCPU
  - Q06HCPU – Q12HCPU
  - Q25HCPU
- Universal model QCPU
  - Q00UJCPU – Q00UCPU
  - Q01UCPU – Q02UCPU
  - Q03UDCPU – Q03UDECPU
  - Q04UDHCPU – Q04UDEHCPU
  - Q06UDHCPU – Q06UDEHCPU
  - Q10UDHCPU – Q10UDEHCPU
  - Q13UDHCPU – Q13UDEHCPU
  - Q20UDHCPU – Q20UDEHCPU
  - Q26UDHCPU – Q26UDEHCPU
- Process CPU
  - Q02PHCPU – Q06PHCPU
  - Q12PHCPU – Q25PHCPU
- Redundant CPU
  - Q12PRHCPU – Q25PRHCPU

**NOTE**

Talking in this manual about Q-CPU means, that all mentioned CPUs are of MELSEC System Q.

### Base units

The Q00JCPU and Q00UJCPU include power supply, CPU and main base unit with five slots. All other CPUs have to be mounted on a main base unit. Additionally one or two power supplies can be mounted and up to twelve modules.

Extension base units can be connected to the main base unit via bus cable. The extension base units are available with or without slots for a separate power supply and with slots for up to twelve modules.

The Q00JCPU and Q00UJCPU can address max. 16 modules on one main base unit and two extension base units.

The CPU modules Q00CPU, Q01CPU, Q00UCPU, Q01UCPU and Q02UCPU are extendable with up to four extension base units and totally 24 modules (36 modules with Q02UCPU).

Except for Q12PRHCPU and Q25PRHCPU, all other CPU types can be extended with seven extension base units with maximum 64 slots total. The maximum distance between main base unit and last extension base unit is 13.2 m, so that the base units can be mounted inside the cabinet with some distance between each other.

- Connecting extension base units to a redundant PLC system

It is not possible to connect an extension base unit to a main base unit with a redundant CPU up to serial no. 09012... The expansion can be done by remote I/O station via MELSECNET/H network.

It is possible to connect a main base unit with a redundant Q12PRHCPU or Q25PRHCPU beginning at serial no. 09012... up to maximum seven extension base units with totally 63 modules.

The first extension base unit must be the type Q65WRB, the second to seventh unit can be of type Q68RB.

### Up to 8192 inputs and outputs

The CPU types Q02(H) to Q25H, the universal model CPUs from Q03UD(E)CPU on, all process CPUs and redundant CPUs can address up to 4096 in/outputs directly on the base unit. Together with remote I/Os these CPUs can address up to 8192 I/O points.

A Q02UCPU can address up to 2048 in/outputs directly and up to 8192 I/Os totally.

The Q00JCPU and Q00UJCPU address 256 I/O points directly. The Q00CPU, Q00UCPU, Q01CPU or Q01UCPU addresses 1024 I/O points. With these CPU types the number is extended to 2048 points and to 8192 points with the universal model PLC CPUs by remote I/Os.

### High speed program processing

CPU types with an additional "H" (like Q12HCPU, Q25HCPU or Q12PHCPU) do a faster processing of the program. The operation time for the LD instruction (load) by the Q02CPU is 79 ns. The same instruction is done in 34 ns by the H type CPU.

An universal model PLC CPU increases the processing speed additionally. The operation time of the above mentioned LD instruction takes only 20 ns with the Q03UDCPU and only 9.5 ns with CPU modules from Q04UDCPU on.

With the new MELSEC System Q main base units with integrated memory and processor the data transfer to I/O modules, intelligent function modules and network modules is much faster compared to the previous base units. The access of the Q02HCPU to an intelligent function module is with 20 µs per word 7 times faster than with the Q2ASHCPU. The refresh cycle of the MELSECNET/10 network is around 4.3 times faster compared to the Q02HCPU and needs only 4.6 ms for 8 kwords.

### Multi CPU operation

Except Q00JCPU all CPU modules of System Q are suitable für multi-CPU operation. Up to four CPU modules can be mounted on one main base unit to which the mounted I/O and intelligent function modules are assigned. The data transfer between the CPU modules can run automatical and cyclic. Also mixed configurations are possible with PLC CPU, Motion Controller CPU and Q PC. But Q00CPU and Q01CPU can't be combined with H type CPUs.

By multi-CPU operation the cycle time is decreased, the performance is increased and the application is wider.

### Redundant operation

The operation of a redundant system is continued, even if single components have a failure. This increases performance and outage and shutdown times are minimized.

The redundant PLC of MELSEC System Q consists of two controllers with identical configurations (power supply, Q12PRHCPU or Q25PRHCPU, network modules, etc.), which are connected by a so called tracking cable. One PLC controls the system, while the other one is in standby mode. In case of an error the system switches from the control system to the standby system and the process continues without any interruption.

Also a PLC with a standard CPU can be protected with two redundant power supplies against failures. Therefore a main base unit and an extension base unit with two types of power supply are available, one with 24 V DC input and one with 100–240 V AC input.

### Range of instructions

Instructions for a Q-CPU are divided into two categories, basic instructions and comprehensive dedicated instructions. The process CPUs and redundant CPUs have additionally 52 process control instructions. Therefore these CPU types are particularly suitable for applications of process technology.

The capacity for the PLC programm is between 8 and 252 k steps depending on the CPU type.

## Memory

In addition to the internal memory (RAM and FlashROM) all CPU types (except Q00(U)JCPU, Q00(U)CPU and Q01(U)CPU) have an extension slot for a RAM or a ROM memory card. The RAM card is protected against data loss with a battery. ROM memory cards are available with capacities up to 32 Mbyte for permanent storage of programs and other data.

## Programming

The instructions in MELSEC System Q for programming of the CPU are according IEC1131 and there are additional MELSEC instructions depending on the programming tools.

### Fast data transfer with programming devices

The connection of the programming device to the CPU module is done by USB interface except the basic model CPUs Q00JCPU, Q00CPU and Q01CPU. The datatransfer speed is then 12 Mbps.

For the Q-CPUs the datatransfer speed via RS232 interface is 115.2 kBaud.

## Mounting

The base unit can be mounted directly by screws or on a DIN rail by adapter. The small dimensions of the modules of System Q allow, that the needed space for system mounting is reduced by 60 % compared with the MELSEC AnS series.

## Direct connection to the ETHERNET

The universal model PLC CPUs (modules with an "E" in the model name like Q10UDEHCPU) are equipped with an ETHERNET interface allowing the direct connection of the PLC to the ETHERNET network.

## Compatibility

Concerning the general programming all the modules of MELSEC System Q are compatible to the other Systems of the MELSEC PLC family. For information about programming of intelligent function modules refer to the User's Manual of the module.

## 2.2 Specification comparison of CPU

The following table gives an overview about the characteristics of each CPU. Chapter 4 describes the detailed performance.

### 2.2.1 Basic model QCPU Q00JCPU, Q00CPU, Q01CPU and Q02CPU

The Q00CPU, Q01CPU and Q02CPU can be used in a multi-CPU system from version B on. Combinations of Q00CPU and Q01CPU are only possible with Motion Controller CPUs and Q-PC. These CPUs can't be operated in one system together with other PLC CPU modules.

Refer to section 4.6 for checking the function version of the CPU module.

|   | <b>Q00JCPU</b> | <b>Q00CPU</b> | <b>Q01CPU</b> | <b>Q02CPU</b>                   |

**Tab. 2-5:** Specification comparison of Q02PH, Q06PH, Q12PH and Q25PH

## 2.2.5 Redundant CPU

It is not possible to connect an extension base unit to a main base unit with redundant CPU. The expansion can be done by remote I/O station via MELSECNET/H network.

A standard main base unit of MELSEC System Q can be used, if you don't need redundant power supplies.

The redundant CPU modules Q12PRHCPU and Q25PRHCPU can't be used with a multi-CPU system.

|   | Q12PRHCPU  | Q25HCPU     |
|---|--|-------------|
| No. of I/O device points (usable on program)                      | 8192   |             |
| No. of I/O device points (Hex)                                    | X/Y000 to 1FFF   |             |
| No. of I/O points (accessible to the actual I/O module)           | 4096   |             |
| No. of I/O device points (Hex)                                    | X/Y000 to FFF  |             |
| SFC (MELSAP-3)  | Possible   |             |
| Processing speed (LD instruction)                                 | 34 ns  |             |

**Tab. 2-6:** Specification comparison of Q12PRH and Q25PRH

### NOTE

For more informations about redundant CPU modules refer to the technical catalogue MELSEC System Q and to the User's Manual of the module.

## 2.2.6 Motion CPU

The motion controller CPU of System Q controls extensive movements by the connected servo amplifiers and servo motors. They only work in a multi-CPU system together with minimum one PLC CPU. Therefore maximum three Motion CPU modules can be mounted on one main base unit.

### Q172CPUN and Q173CPUN

| Weight  |                    | 0.33 kg   | 0.33 kg   |
| Dimensions (HxWxD) [mm]   |                    | 98x27.4x119.3                                   |   |

**Tab. 2-9:** Specification comparison of Q172DCPU and Q173DCPU

**NOTE**

For more informations about motion controllers and operating system software refer to the technical catalogue MELSEC System Q and to the User's Manual of the module and the software.

## 2.2.7 PC CPU module

The PC CPU module is a compact personal computer of high value which can be installed on the main base unit. Combinations with other CPU modules in a multi-CPU system are possible. Besides typical functions of a PC, the PC CPU can also handle PLC functions.

|                         |                 | <b>PC-CPU</b>   |
|-------------------------|-----------------|---|
| CPU                     |                 | Ultra low voltage Intel® Celeron® M processor   |
| Processing frequency    |                 | 600 MHz   |
| Memory                  |                 | 512 MB (main)/2 x 32 kB L1 (cache), 1 x 512 kB L2 (cache)   |
| Video                   |                 | Integrated graphics board for a maximum resolution of 1280x1024 pixels, 16 mio. colours                             |
| Interfaces              | Serial (RS232C) | 2 (1 integrated 9-pin D-SUB connector and 1 optional interface at the extension box which is connected to "EX I/F") |
|                         | Parallel        | 1   |
|                         | USB             | 4 (3 integrated 9-pin D-SUB connector and 1 optional interface at the extension box which is connected to "EX I/F") |
|                         | Keyboard/mouse  | 1 x PS/2 connector (keyboard and mouse can be used at the same time with the Y junction cable)                      |
|                         | LAN             | 1 x ETHERNET interface (100BASE-TX/10BASE-T)  |
|                         | Monitor         | 1 x 15-pin H-DSUB   |
| Connections for drives  |                 | 1 x disk drive, 2 x hard disk (silicon hard disks are supported)  |
| PC card slots           |                 | 2 PCMCIA, CardBus   |
| Dimensions (HxDxW) [mm] |                 | 98x55.2x115   |

**Tab. 2-10:** PC CPU module of MELSEC System Q

**NOTE**

For more informations about PC CPU modules refer to the technical catalogue MELSEC System Q.

## 2.2.8 C-Controller CPU

The C-Controller CPUs Q06CCPU and Q12DCCPU with the powerful VxWorks operating system are programmed in C or C++. Therefore they are suitable especially for complex tasks in data processing.

The C-Controller CPUs have the same compact dimensions as the other CPU modules of MELSEC System Q and can be combined with them in a multi-CPU system or operate stand alone. Additionally the C-Controller CPUs are compatible with CoDeSys.

|                            |                       |     | <b>Q06CCPU-V-H01</b>   | <b>Q12DCCPU-V</b>  |  |  |
|----------------------------|-----------------------|-----|--|--|--|--|
| CPU                        |                       |     | SH-4   | SH-4A  |  |  |
| Operating system           |                       |     | VxWorks 5.4 (preinstalled))                                      | VxWorks 6.4 (preinstalled))                                      |  |  |

**Tab. 2-11: Specifications of C-Controller CPUs**

\* Licenses with special conditions for Mitsubishi users are available directly from Wind River

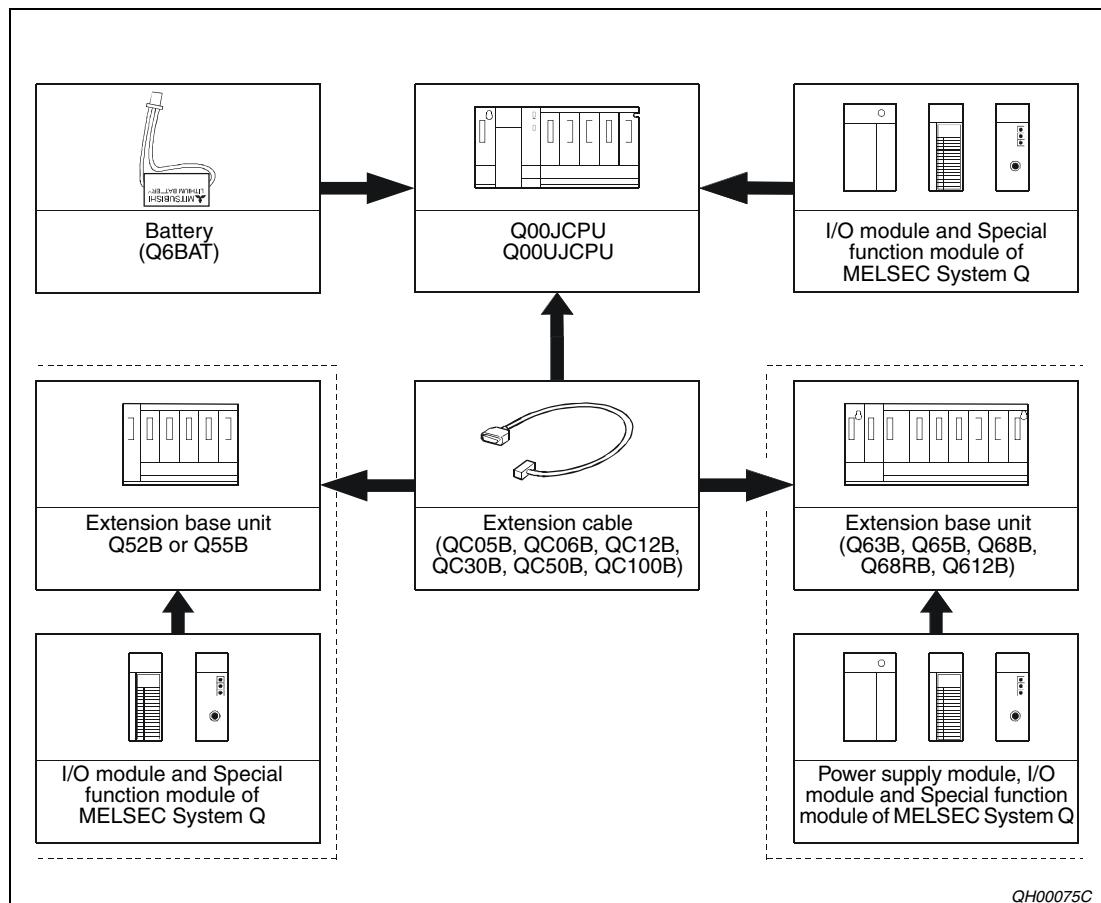

### NOTE

For more informations about C-Controller CPUs refer to the technical catalogue MELSEC System Q.

# 3 System configuration

## 3.1 Overall configuration

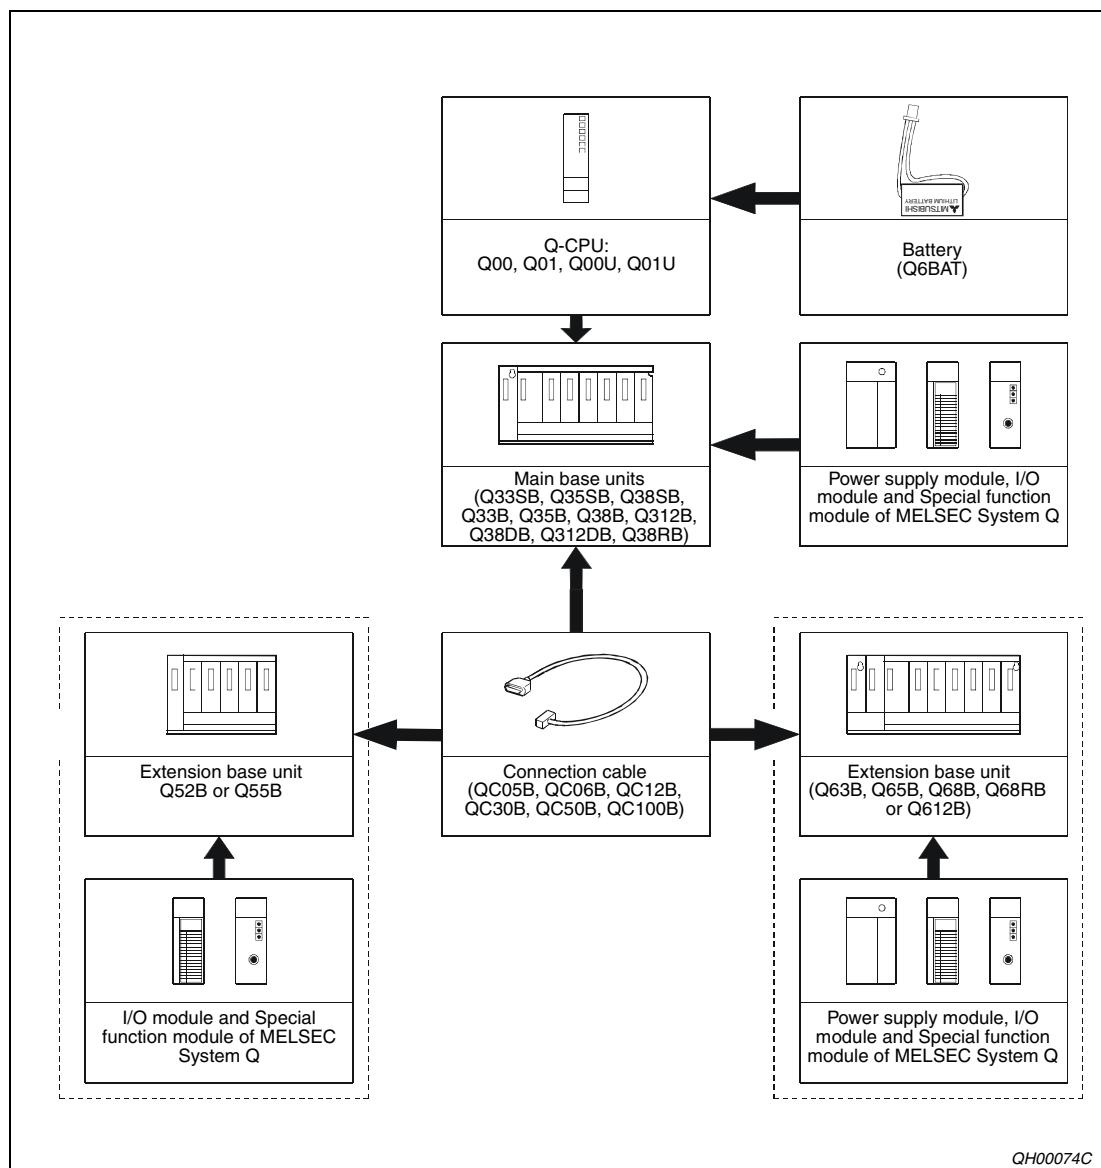

Following figure shows the system configuration for a Q00JCPU or Q00UJCPU using a combination of main base unit, CPU and power supply module.

**Fig. 3-1:** System configuration for Q00JCPU and Q00UJCPU

QH00075C

Following figure shows the system configuration for a Q00CPU, Q01CPU, Q00UCPU or Q01UCPU (all without slots for a memory card).

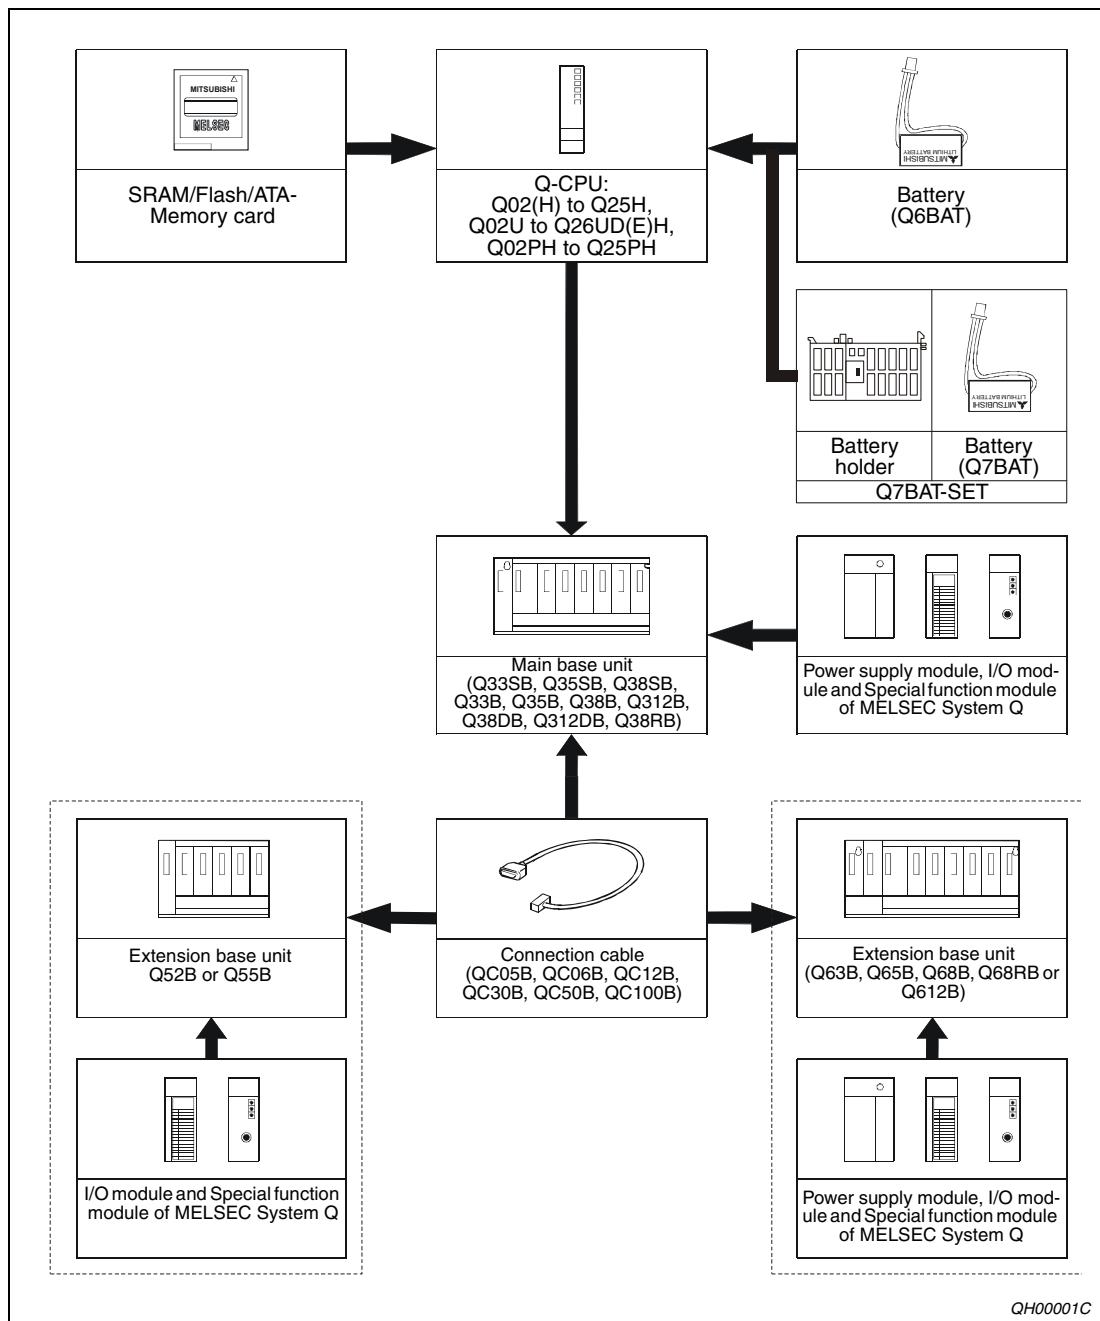

**Fig. 3-2: System configuration for Q00CPU, Q01CPU, Q00UCPU and Q01UCPU**

#### NOTES

It is only possible to mount the redundant power supplies Q63RP and Q64RP on a main base unit of type Q38RB and Q68RB. Each base unit has two slots for redundant power supplies.

The slim type main base units Q32SB, Q33SB and Q35SB can't be connected to extension base unit.

System configuration for CPU types Q02(P)(H) to Q25(P)H and Q02U to Q26UD(E)H:

**Fig. 3-3:** System configuration for CPUs Q02(H) to Q25H, Universal CPUs Q02U to Q26UD(E)H and Process CPUs Q02PH to Q25PH

#### NOTES

Battery Q7BAT is not available in EU countries.

It is only possible to mount the redundant power supplies Q63RP and Q64RP on a main base unit of type Q38RB and Q68RB. Each base unit has two slots for redundant power supplies.

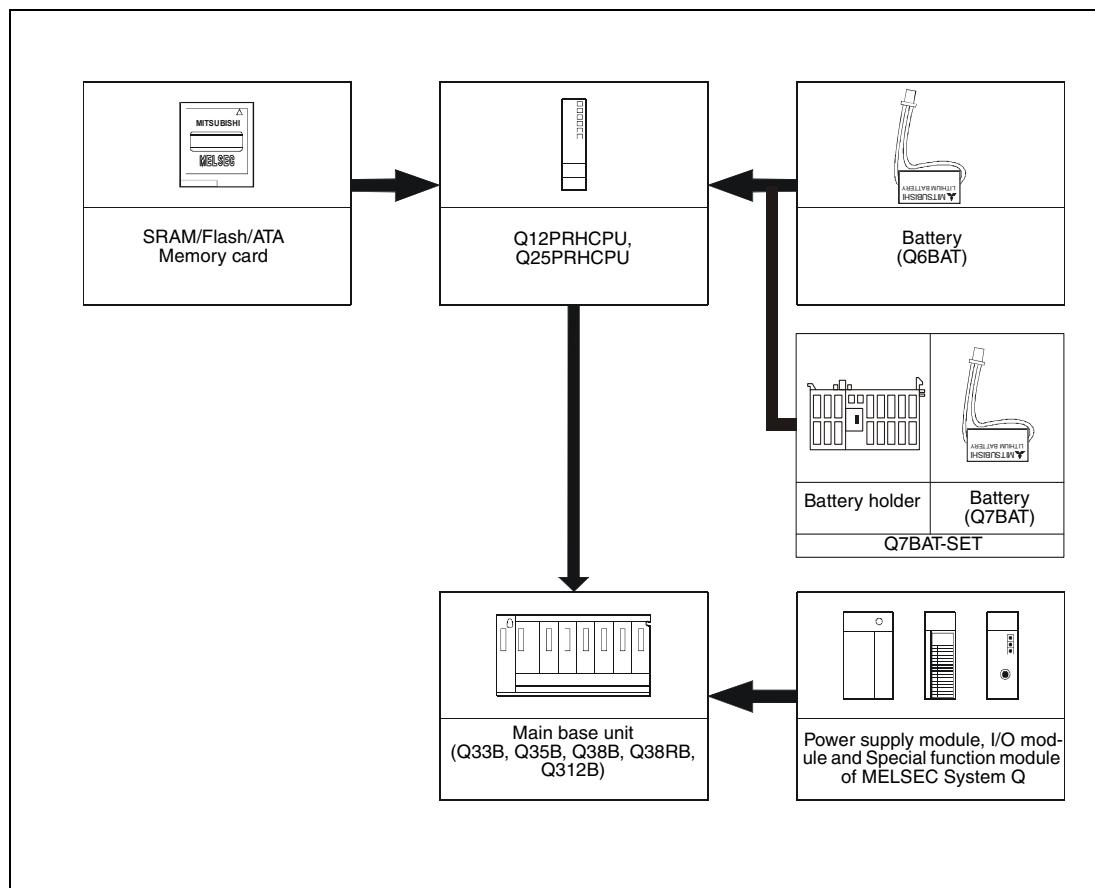

The process CPU modules Q02PHCPU to Q25PHCPU can't be mounted on the slim type main base units Q32SB, Q33SB and Q35SB.

The slim type main base units Q32SB, Q33SB and Q35SB can't be connected to extension base unit.

The following figure shows the system configuration of a redundant PLC with Q12PRH or Q25PRH CPU types.

The redundant PLC of MELSEC System Q consists of two systems with identical configurations (power supply, CPU module, network modules, etc.), which are connected by tracking cable. One PLC controls the system, while the other one is in standby for reserve.

For more informations about configuration and applicable modules refer to the technical catalogue MELSEC System Q and to the User's Manual of the redundant PLC module.

**Fig. 3-4:** System configuration for Q12PRH- and Q25PRHCPU

#### NOTES

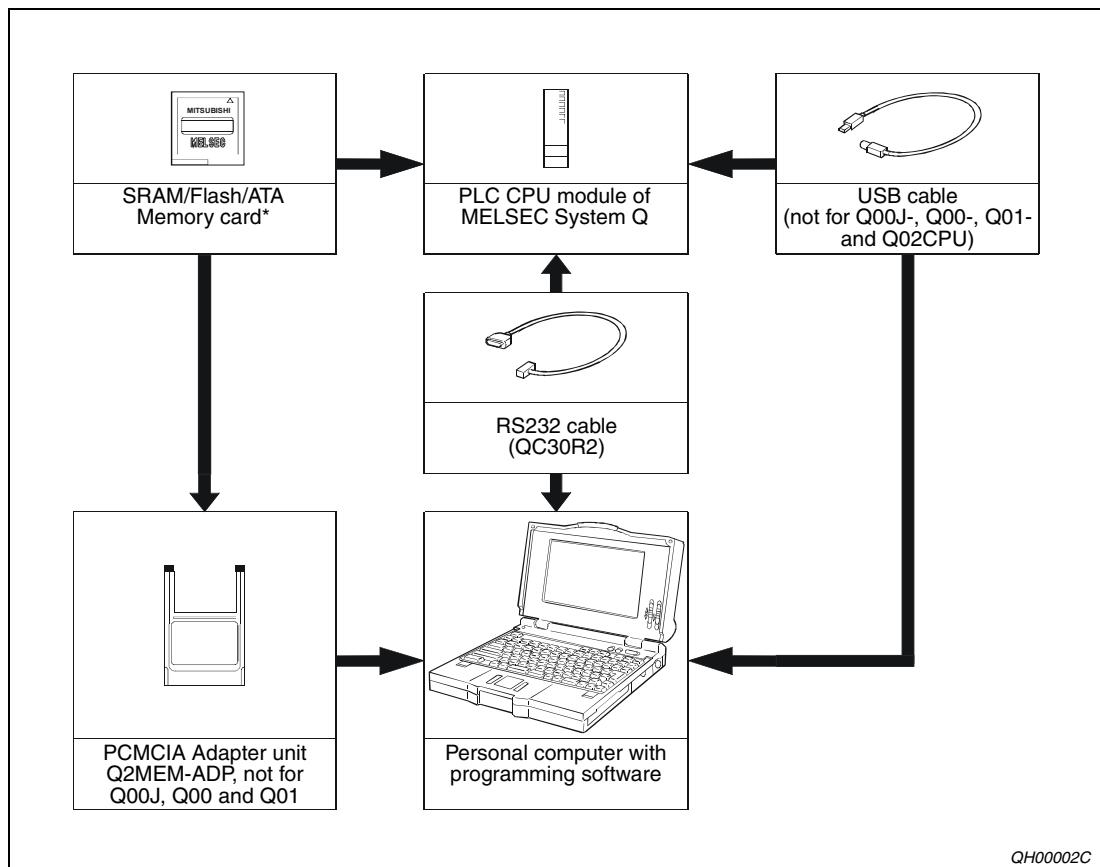

Battery Q7BAT is not available in EU countries.

It is only possible to mount the redundant power supplies Q63RP and Q64RP on a main base unit of type Q38RB and Q68RB. Each base unit has two slots for redundant power supplies.

It is not possible to connect an extension base unit to a main base unit with a redundant CPU up to serial no. 09012... The expansion can be done by remote I/O station via MELSECNET/H network.

It is possible to connect up to maximum seven extension base units with totally 63 modules with a redundant Q12PRHCPU or Q25PRHCPU beginning at serial no. 09012... In the first stage the base unit Q65WRB should be connected directly to the main base unit. The base units Q68RB should be used for the second to seventh stage.

Following figure shows the configuration for programming of a Q-CPU:

**Fig. 3-5: Programming the PLC CPU of MELSEC System Q**

\* The basic model QCPU, Q00U(J)CPU, Q01UCPU do not support memory cards.

#### NOTES

Programming of the Q-CPPUs is done with the following software:

- GX Developer
- GX IEC Developer

For special functions of the Q-CPPUs and for transfer of programs to memory cards or over USB cable please refer to the User's Manuals of GX IEC Developer and GX Developer.

## 3.2 Overall system

### 3.2.1 Modules of MELSEC System Q

#### CPU modules

| Type                               | Description  | Power consumption (mA)   |         | Note |

**Tab. 3-4:** Communication-, interface- and remote modules

### Base units and accessories

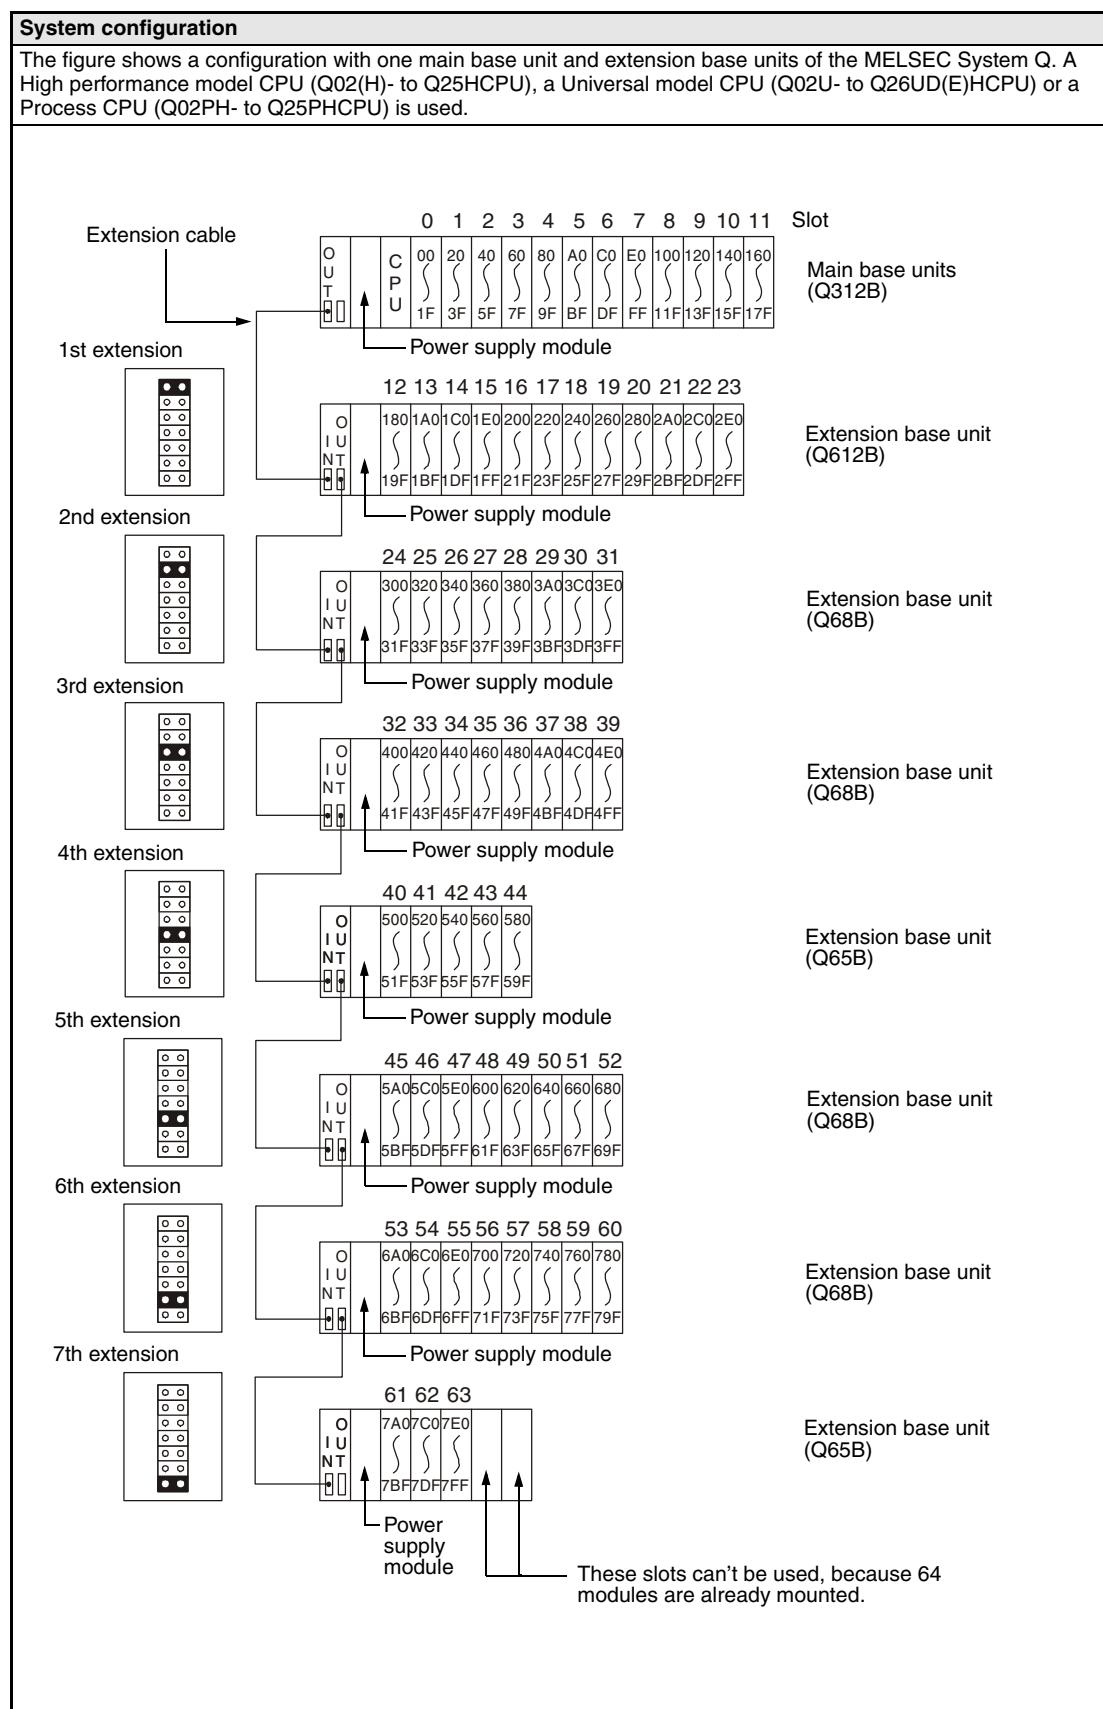

| Type                        | Description  | Note  |
|-----------------------------|--|---|
| <b>Main base units</b>      |  |   |
| Q32SB                       | For power supply module, CPU and up to 2 modules   | <ul style="list-style-type: none"> <li>• Slim type main base unit</li> <li>• It is not possible to connect an extension base unit.</li> </ul>                                   |
| Q33SB                       | For power supply module, CPU and up to 3 modules   |   |
| Q35SB                       | For power supply module, CPU and up to 5 modules   |   |
| Q33B-E                      | For power supply module, CPU and up to 3 modules   | <ul style="list-style-type: none"> <li>• Connection of extension base units possible</li> </ul>   |
| Q35B-E                      | For power supply module, CPU and up to 5 modules   |   |
| Q38B-E                      | For power supply module, CPU and up to 8 modules   |   |
| Q38DB                       | For power supply module, CPU and up to 8 modules   | <ul style="list-style-type: none"> <li>• Connection of extension base units possible</li> <li>• Multiple CPU high speed transmission base unit</li> </ul>                       |
| Q38RB-E                     | For 2 redundant power supply modules, CPU and up to 8 modules  | <ul style="list-style-type: none"> <li>• Connection of extension base units possible</li> </ul>   |
| Q312B-E                     | For power supply module, CPU and up to 12 modules  |   |
| Q312DB                      | For power supply module, CPU and up to 8 modules   | <ul style="list-style-type: none"> <li>• Connection of extension base units possible</li> <li>• Multiple CPU high speed transmission base unit</li> </ul>                       |
| <b>Extension base units</b> |  |   |
| Q52B                        | For up to 2 modules  | <ul style="list-style-type: none"> <li>• Without power supply, connect only with cable QC05B</li> </ul>   |
| Q55B                        | For up to 5 modules  |   |
| Q63B                        | For up to 3 modules  | <ul style="list-style-type: none"> <li>• Depending on the CPU type are up to 7 extension base units connectible to the main base unit with maximum 64 slots totally.</li> </ul> |
| Q65B                        | For up to 5 modules  |   |
| Q65WRB                      | For 2 redundant power supply modules and up to 5 modules (redundant local I/O of a redundant system) |   |
| Q68B                        | For power supply module and up to 8 modules  |   |
| Q68RB-E                     | For 2 redundant power supply modules and up to 8 modules   |   |
| Q612B                       | For power supply module and up to 12 modules   |   |
| <b>Connection cable</b>     |  |   |
| QC05B                       | Cable length: 0.45 m   | <ul style="list-style-type: none"> <li>• For connecting Q52B and Q55B only</li> <li>• For connecting the base units</li> </ul>  |
| QC06B                       | Cable length: 0.6 m  |   |
| QC12B                       | Cable length: 1.2 m  |   |
| QC30B                       | Cable length: 3 m  |   |
| QC50B                       | Cable length: 5 m  |   |
| QC100B                      | Cable length: 10 m   |   |
| <b>Tracking cable</b>       |  |   |
| QC10TR                      | Cable length: 1 m  | For connecting the 2 CPU modules of a redundant system.   |
| QC30TR                      | Cable length: 3 m  |   |

**Tab. 3-5:** Base units and accessories

| Type   | Description                            | Note  |
|--|--|---|
| <b>Memory cards</b>  |  |   |
| Q2MEM-1MBS   | 1 MByte SRAM                           | —   |
| Q2MEM-2MBS   | 2 MByte SRAM                           | —   |
| Q3MEM-4MBS   | 4 MByte SRAM                           | For Universal model QCPU only   |
| Q3MEM-8MBS   | 8 MByte SRAM                           |   |
| Q2MEM-2MBF   | 2 MByte Flash card                     | —   |
| Q2MEM-4MBF   | 4 MByte Flash card                     | —   |
| Q2MEM-8MBA   | 8 MByte ATA memory card                | —   |
| Q2MEM-16MBA  | 16 MByte ATA memory card               | —   |
| Q2MEM-32MBA  | 32 MByte ATA memory card               | —   |
| <b>Memory card adapter</b>                                       |  |   |
| Q2MEM-ADP  |  | Memory card adapter for PCMCIA slot   |
| <b>Batteries</b>   |  |   |
| Q6BAT  | Buffer battery for CPU module          | The battery is shipped together with the CPU.   |
| Q2MEM-BAT  | Memory card Q2MEM-1MBS buffer battery  | —   |
| <b>Connector disconnection prevention holder for RS232 cable</b> |  |   |
| Q6HLD-R2   | Mechanical fixing device for connector | This is recommended, when a cable is connected permanently to the RS232 interface, e. g. for connection to a GOT. |

An error occurs, when the maximum number of modules is exceeded.</li> <li>• The overall length of extension cables must not be longer than 13.2 m.</li> <li>• Connect the OUT connector of an extension base unit and the IN connector of the adjacent extension base unit by an extension cable.</li> <li>• Do not lay tracking cables close together or close to main circuit power lines, high-voltage power lines, or load lines.</li> <li>• Set the extension stage numbers consecutively. Set an unique number for each extension base.</li> <li>• The extension base units Q38RB, Q68RB have slots for two redundant power supplies Q63RP or Q64RP.</li> <li>• The slim type main base units Q32SB, Q33SB and Q35SB can't be connected to extension base unit.</li> <li>• The process CPU modules Q02PH-, Q06PH-, Q12PH- and Q25PHCPU can't be mounted on the slim type main base units Q32SB, Q33SB and Q35SB.</li> </ul> |

**Tab. 3-6:** System configuration

# 4 CPU modules

## 4.1 Devices

The names and data ranges of devices which can be used in the CPU module are shown in the following tables.

### 4.1.1 Basic model QCPU

| Device name |                    | Range (total number)  |  |        | Explanation  |
|-------------|--------------------|---|--|--------|--|
|             |                    | Q00JCPU   | Q00CPU   | Q01CPU |  |
| X           | Input              | X0–7FF<br>(No. of I/O device points: 2048)<br>X0–FF (direct accessible: 256)  | X0–7FF<br>(total number of I/O points: 2048)<br>X0–3FF<br>(I/O points accessible via base units: 1024) |        | Input of external signals to the PLC, e. g. by key switch, rotary switch, limit switch, binary switch  |
| Y           | Output             | Y0–7FF<br>(No. of I/O device points: 2048)<br>Y0–FF (direct accessible: 256)  | Y0–7FF<br>(total number of I/O points: 2048)<br>Y0–3FF<br>(I/O points accessible via base units: 1024) |        | Output of signals for control of external devices by program like magnetic valves, magnetic contactors, lamps, digital displays etc.   |
| M           | Special relay      | SM0–1023 (1024)   |  |        | Predefined devices for special applications and additional functions of the PLC.   |
|             | Internal relay*    | M0–8191 (8192)  |  |        | Auxiliary devices of the PLC   |
| L           | Latch relay*       | L0–2047 (2048)  |  |        | Auxiliary devices of the PLC<br>Latch relays are buffered at power shutdown  |
| S           | Step relay         | S0–2047 (2048)  |  |        | Application like M device, e. g. for marking one step number in a program for step operation of a process.   |
| B           | Link relay*        | B0–3FF (1024)   |  |        | Bit devices in a network, which can't be output directly   |
| F           | Announcer*         | F0–1023 (1024)  |  |        | Flag for marking of an error.<br>If the error flag is set by an error recognition program during RUN operation, the corresponding error code will be stored in the special relay SD. |
| V           | Edge relay*        | V0–2047 (2048)  |  |        | This relay is set by the negativ or positiv edge of the operation result, depending on the instruction.  |
| T           | Timer*             | T0–511 (512)<br>The low- and high-speed timers are specified by the instructions.   |  |        | Incremental timer<br>Measurement unit of the low-speed retentive timers: 1 to 1000 ms, 1 ms unit (100 ms by default)   |
| T (ST)      | Retentive timer*   | Max. 512<br>The retentive timers are specified by parameters (preset to 0)<br>The low- and high-speed retentive timers are specified by the instructions. |  |        | Measurement unit of the high-speed retentive timers: 0.1 to 100.0 ms, 0.1 ms unit (10.0 ms by default)   |
| C           | Counter*           | C0–511 (512)  |  |        | Incremental counter for normal or interrupt processing   |
|             | Interrupt Counter* | Max. 128<br>(0 point by default, setting by parameters)   |  |        |  |
| D           | Data register*     | D0–11135 (11136)  |  |        | Register for data storage  |
| SD          | Special register   | SD0–1023 (1024)   |  |        | Predefined register for storage of special data  |

**Tab. 4-1:** Device list for Q00JCPU, Q00CPU and Q01CPU

| Device name                        | Range (total number)  |                   |                   | Explanation   |  |
|------------------------------------|---|-------------------|-------------------|---|--|
|                                    | Q00JCPU   | Q00CPU            | Q01CPU            |   |  |
| W Link register*                   | W0–7FF (2048)   |                   |                   | Register for Link data in a network   |  |
| R File register                    | —   | R0–32767 (32768)  | ZR0–32767 (32768) | Extension of the data register area   |  |
|                                    |   | ZR0–32767 (32768) |                   |   |  |
| SB Link special relay              | SB0–3FF (1024)  |                   |                   | Bit devices in a network  |  |
| SW Link special register           | SW0–3FF (1024)  |                   |                   | Register for Link data  |  |
| Z Index register                   | Z0–9 (10)   |                   |                   | Register for indexing of devices  |  |
| N Nesting                          | N0–14 (15 Steps)  |                   |                   | Displays the nesting of Master control processes  |  |
| P Pointer                          | P0–299 (300)<br>The common pointer address is set by parameters.  |                   |                   | Target of a jump instruction (CJ, SCJ, CALL, JMP)   |  |
| I Interrupt Pointer                | I0–127 (128)<br>The cyclic interval of system interrupt pointers I28 to 31 can be set up by parameters (2 to 1000 ms, 1 ms unit).<br>Default values:<br>I28: 100 ms; I29: 40 ms; I30: 20 ms; I31: 10 ms |                   |                   | Pointer for branching of interrupt programs   |  |
| K Decimal constant                 | <ul style="list-style-type: none"> <li>• K -32768–32767 (16 bit instructions)</li> <li>• K -2147483648–2147483647 (32 bit instructions)</li> </ul>  |                   |                   | For specification of command values for timer and counter, pointer, interrupt pointer, number of bit devices and instruction values |  |
| H Hexadecimal constant             | <ul style="list-style-type: none"> <li>• H0–FFFF (16 bit instruction)</li> <li>• H0–FFFFFF (32 bit instruction)</li> </ul>  |                   |                   | For specification of instruction values   |  |
| FX Function input                  | FX0–F (16)  |                   |                   | Devices for the status of input or output bits for subroutines.<br>Only FX0 to FX4 and FY0 to FY4 can be used in a program.         |  |
| FY Function output                 | FY0–F (16)  |                   |                   |   |  |
| FD Function register               | FD0–4 (5)   |                   |                   | Status register for the input and output bits for subroutines   |  |
| Link direct device                 | Specified form: J□□X□□, J□□Y□□, J□□W□□, J□□B□□, J□□SW□□, J□□SB□□  |                   |                   | Device for accessing the link device directly. Exclusively used for CC-Link IE controller network and MELSEC-NET/H.                 |  |
| Intelligent function module device | Specified form: U□□G□□  |                   |                   | Device for accessing the buffer memory of the intelligent function module directly.   |  |

**Tab. 4-1:** Device list for Q00JCPU, Q00CPU and Q01CPU

\* The address areas for these devices can be set with a programming device by parameters. The table shows the preset values.

## 4.1.2 High performance model QCPU

| Device name |                    | Range (total number)   |         |         |         |         | Explanation  |
|-------------|--------------------|--|---------|---------|---------|---------|--|
|             |                    | Q02CPU   | Q02HCPU | Q06HCPU | Q12HCPU | Q25HCPU |  |
| X           | Input              | X0–1FFF (total number of I/O points: 8192)<br>X0–0FFF (I/O points accessible via base units: 4096)   |         |         |         |         | Input of external signals to the PLC, e. g. by key switch, rotary switch, limit switch, binary switch  |
| Y           | Output             | Y0–1FFF (total number of I/O points: 8192)<br>Y0–0FFF (I/O points accessible via base units: 4096)   |         |         |         |         | Output of signals for control of external devices by program like magnetic valves, magnetic contactors, lamps, digital displays etc.   |
| M           | Special relay      | SM0–2047 (2048)  |         |         |         |         | Predefined devices for special applications and additional functions of the PLC.   |
|             | Internal relay*    | M0–8191 (8192)   |         |         |         |         | Auxiliary devices of the PLC   |
| L           | Latch relay*       | L0–8191 (8192)   |         |         |         |         | Auxiliary devices of the PLC<br>Latch relays are buffered at power shutdown  |
| S           | Step relay         | S0–8191 (8192)   |         |         |         |         | Application like M device, e. g. for marking one step number in a program for step operation of a process.   |
| B           | Link relay*        | B0–1FFF (8192)   |         |         |         |         | Bit devices in a network, which can't be output directly   |
| F           | Announcer*         | F0–2047 (2048)   |         |         |         |         | Flag for marking of an error.<br>If the error flag is set by an error recognition program during RUN operation, the corresponding error code will be stored in the special relay SD. |
| V           | Edge relay*        | V0–2047 (2048)   |         |         |         |         | This relay is set by the negative or positive edge of the operation result, depending on the instruction.  |
| T           | Timer*             | T0–2047 (2048)<br>The low- and high-speed timers are specified by the instructions.  |         |         |         |         | Incremental timer<br>Measurement unit of the low-speed retentive timers: 1 to 1000 ms, 1 ms unit (100 ms by default)   |
| T(ST)       | Retentive timer*   | Max. 2048, The retentive timers are specified by parameters (preset to 0)<br>The low- and high-speed retentive timers are specified by the instructions. |         |         |         |         | Measurement unit of the high-speed retentive timers: 0.1 to 100.0 ms, 0.1 ms unit (10.0 ms by default)   |
|             | Counter*           | C0–1023 (1024)   |         |         |         |         | Incremental counter for normal or interrupt processing   |
| C           | Interrupt Counter* | Max. 256<br>(0 point by default, setting by parameters)  |         |         |         |         |  |
|             | Data register*     | D0–12287 (12288)   |         |         |         |         | Register for data storage  |
| SD          | Special register   | SD0–2047 (2048)  |         |         |         |         | Predefined register for storage of special data  |
| W           | Link register*     | W0–1FFF (8192)   |         |         |         |         | Register for Link data in a network  |

**Tab. 4-2:** Device list for Q02(H)-, Q06H-, Q12H- and Q25HCPU

| Device name                        |                       | Range (total number)  |         |         |         |         | Explanation   |
|------------------------------------|-----------------------|---|---------|---------|---------|---------|---|
|                                    |                       | Q02CPU  | Q02HCPU | Q06HCPU | Q12HCPU | Q25HCPU |   |

| N                                  | Nesting               | N0–14 (15 Steps)  |         |         |         |         | Displays the nesting of Master control<br>processes   |
| P                                  | Pointer               | P0–4095 (4096)<br>The common pointer address is set by parameters.  |         |         |         |         | Target of a jump instruction (CJ, SCJ,<br>CALL, JMP)  |
| I                                  | Interrupt Pointer     | I0–255 (256)<br>The constant cyclic interval of system interrupt pointers I28<br>to 31 can be set up by parameters (0.5 to 1000 ms, 0.5 ms<br>unit).<br>Default values:<br>I28: 100 ms; I29: 40 ms; I30: 20 ms; I31: 10 ms  |         |         |         |         | Pointer for branching of interrupt pro-<br>grams  |
| K                                  | Decimal constant      | <ul style="list-style-type: none"> <li>K -32768–32767 (16 bit instructions)</li> <li>K -2147483648–2147483647 (32 bit instructions)</li> </ul>  |         |         |         |         | For specification of command values<br>for timer and counter, pointer, interrupt<br>pointer, number of bit devices and<br>instruction values                                    |
| H                                  | Hexadecimal constant  | <ul style="list-style-type: none"> <li>H0–FFFF (16 bit instruction)</li> <li>H0–FFFFFF (32 bit instruction)</li> </ul>  |         |         |         |         | For specification of instruction values   |
| FX                                 | Function input        | FX0–F (16)  |         |         |         |         | Device for the status of input bits for<br>subroutines.   |
| FY                                 | Function output       | FY0–F (16)  |         |         |         |         | Device for the status of output bits for<br>subroutines.  |
| FD                                 | Function register     | FD0–4 (5)   |         |         |         |         | Status register for the input and output<br>bits for subroutines  |
| Link direct device                 |                       | Specified form: J□□\X□□, J□□\Y□□, J□□\W□□,<br>J□□\B□□, J□□\SW□□, J□□\SB□□   |         |         |         |         | Device for accessing the link device<br>directly. Exclusively used for CC-Link<br>IE controller network and MELSEC-<br>NET/H.   |
| Intelligent function module device |                       | Specified form: U□□\G□□   |         |         |         |         | Device for accessing the buffer mem-<br>ory of the intelligent function module<br>directly.   |

**Tab. 4-2:** Device list for Q02(H)-, Q06H-, Q12H- and Q25HCPU

\* The address areas for these devices can be set with a programming device by parameters. The table shows the preset values.

### 4.1.3 Universal model QCPU

#### Q00UJCPU, Q00UCPU, Q01UCPU

| Device name |                         | Range (total number)   |  |  | Explanation  |
|-------------|-------------------------|--|--|--|--|
|             |                         | Q00UJCPU   | Q00UCPU  | Q01UCPU                                |  |
| X           | Input                   | X0–1FFF<br>(No. of I/O device points: 8192)<br>X0–FF (direct accessible: 256)  | X0–1FFF<br>(total number of I/O points: 8192)<br>X0–3FF (I/O points accessible via base units: 1024) |  | Input of external signals to the PLC, e. g. by key switch, rotary switch, limit switch, binary switch  |
| Y           | Output                  | Y0–7FF<br>(No. of I/O device points: 2048)<br>Y0–FF (direct accessible: 256)   | Y0–7FF<br>(total number of I/O points: 2048)<br>Y0–3FF (I/O points accessible via base units: 1024)  |  | Output of signals for control of external devices by program like magnetic valves, magnetic contactors, lamps, digital displays etc.   |
| M           | Special relay           | SM0–2047 (2048)  |  |  | Predefined devices for special applications and additional functions of the PLC.   |
|             | Internal relay*         | M0–8191 (8192)   |  |  | Auxiliary devices of the PLC   |
| L           | Latch relay*            | L0–8191 (8192)   |  |  | Auxiliary devices of the PLC<br>Latch relays are buffered at power shutdown  |
| S           | Step relay              | S0–8191 (8192)   |  |  | Application like M device, e. g. for marking one step number in a program for step operation of a process.   |
| B           | Link relay*             | B0–1FFF (8192)   |  |  | Bit devices in a network, which can't be output directly   |
| F           | Announcer*              | F0–2047 (2048)   |  |  | Flag for marking of an error.<br>If the error flag is set by an error recognition program during RUN operation, the corresponding error code will be stored in the special relay SD.   |
| V           | Edge relay*             | V0–2047 (2048)   |  |  | This relay is set by the negativ or positiv edge of the operation result, depending on the instruction.  |
| T           | Timer*                  | T0–2047 (2048)<br>The low- and high-speed timers are specified by the instructions.  |  |  | Incremental timer<br>Measurement unit of the low-speed retentive timers: 1 to 1000 ms, 1 ms unit (100 ms by default)<br>Measurement unit of the high-speed retentive timers: 0.1 to 100.0 ms, 0.1 ms unit (10.0 ms by default) |
| T (ST)      | Retentive timer*        | The retentive timers are specified by parameters (preset to 0).<br>The low- and high-speed retentive timers are specified by the instructions. |  |  |  |
| C           | Counter*                | C0–1023 (1024)   |  |  | Incremental counter for normal or interrupt processing   |
| D           | Data register*          | D0–12287 (12288)   |  |  | Register for data storage  |
|             | Extended data register* |  |  | Specified by parameters (preset to 0). |  |
| SD          | Special register        | SD0–2047 (2048)  |  |  | Predefined register for storage of special data  |
| W           | Link register*          | W0–1FFF (8192)   |  |  | Register for Link data in a network  |
|             | Extended link register* | —  |  | Specified by parameters (preset to 0). |  |

**Tab. 4-3:** Device list for Q00UJCPU, Q00UCPU and Q01UCPU

| Device name                        |                       | Range (total number)   |   |   | Explanation   |
|------------------------------------|-----------------------|--|---|---|---|

| Intelligent function module device |                       | Specified form: U□□G□□  | Device for accessing the buffer memory of the intelligent function module directly.  |

**Tab. 4-7:** Device list of Q12PRH- and Q25PRHCPU

- \* The address areas for these devices can be set with a programming device by parameters. The table shows the preset values.

## 4.2 Memory capacity

A CPU of MELSEC System Q can access different memory devices, which differ in the drive number. In addition to the internal memory (RAM and FlashROM) all CPU types (except Q00(U)JCPU, Q00(U)CPU and Q01(U)CPU) have an extension slot for a memory card. Depending on the type of memory card, the access to this slot is by drive 1 or drive 2.

**Fig. 4-1:** Memory configuration of MELSEC System Q-CPU modules

The next pages show the memory capacities of the CPU modules.

**Basic model QCPU and High performance model QCPU**

## 4.3 Notes for handling

### Precautions

Do not drop the module case or subject it to heavy impact since it is made of resin. Do not remove the printed-circuit board of each module from its case.

When drilling screw holes or wiring, cutting chips or wire chips should not enter ventilation slits.

**NOTE**

Fixing the module with a screw

The modules of MELSEC System Q can be secured with an additional screw (M3×12) to the base unit. Under normal conditions this screw is not needed. But it is recommended to use the screw, if large vibration is expected.

Tighten the module fixing screws within the specified tightening torque range of 36 to 48 Ncm.

**CAUTION:**

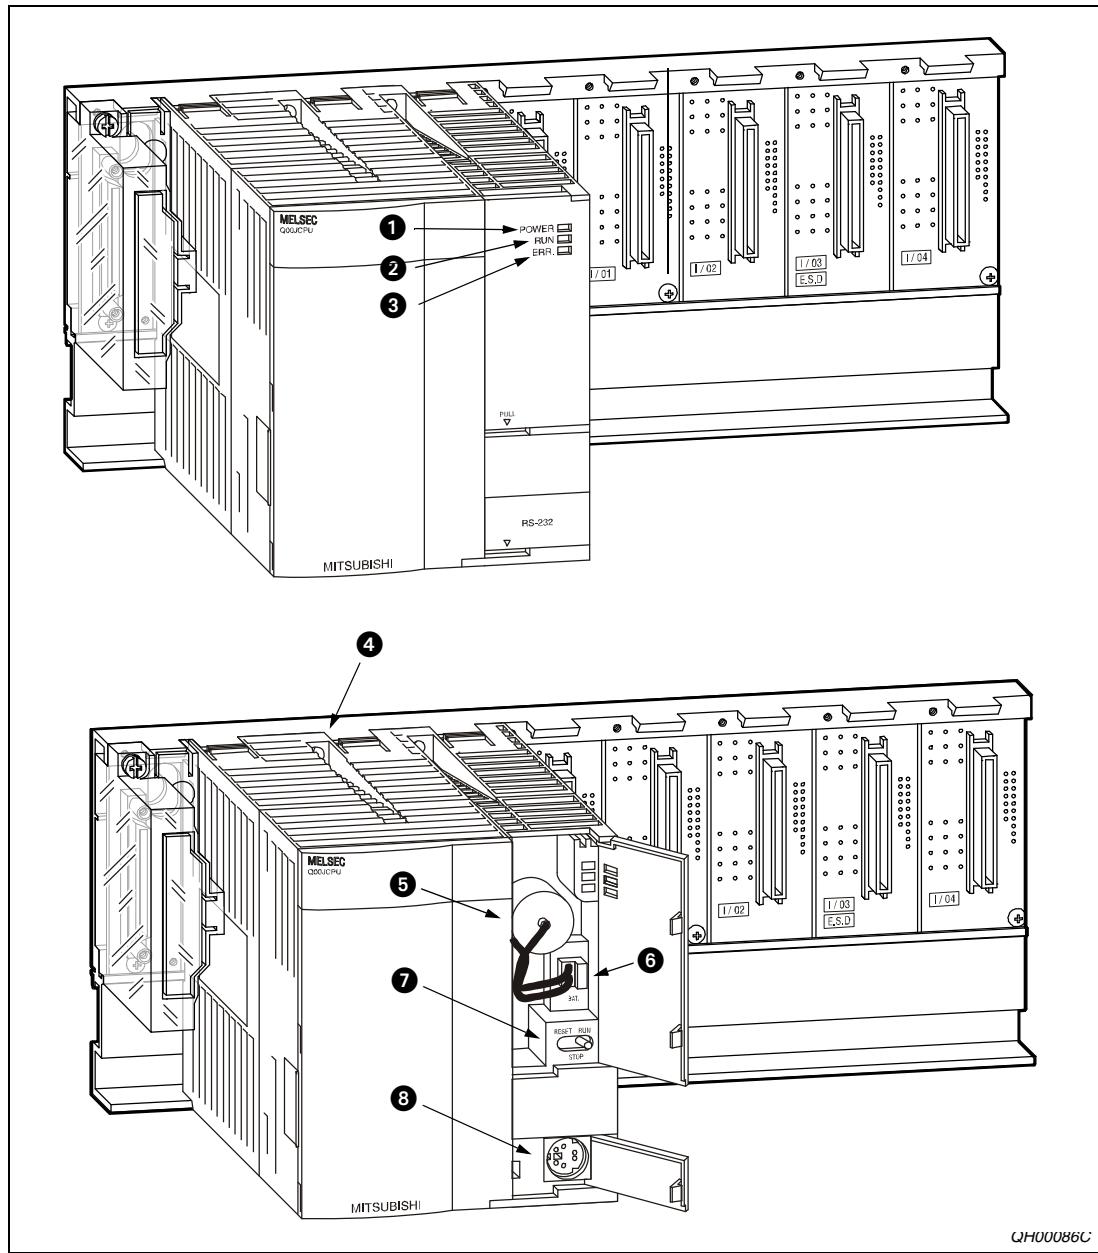

- *Do not open the case of a module. Do not modify a module. This may cause fire, injuries or malfunction.*
- *Use the product in the environment within the general specifications described in the Hardware Manual of MELSEC System Q. Never use the product in areas with dust, oily smoke, conductive dusts, corrosive or flammable gas, vibrations or impacts, or expose it to high temperature, condensation, or wind and rain.*
- *Cut off all phases of the power source externally before starting the installation or wiring work. Not doing so may cause failure or malfunction of the module.*
- *Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.*
- *After the first use of the product, do not mount or remove the module to or from the base unit, and the terminal block to or from the module more than 50 times (IEC 61131-2 compliant) respectively. Exceeding this limit may cause malfunction.*
- *Before handling modules, touch a grounded metal object to discharge the static electricity from the human body.*

## 4.4 Part names and settings of Qn(P)(R)(H)CPUs

This chapter explains the part names and settings of the PLCs with basic model CPU, high performance model CPU, process CPU and redundant CPU. The following section 4.5 is about the part names and settings of the PLCs with universal model CPU.

### 4.4.1 Part names of CPU modules

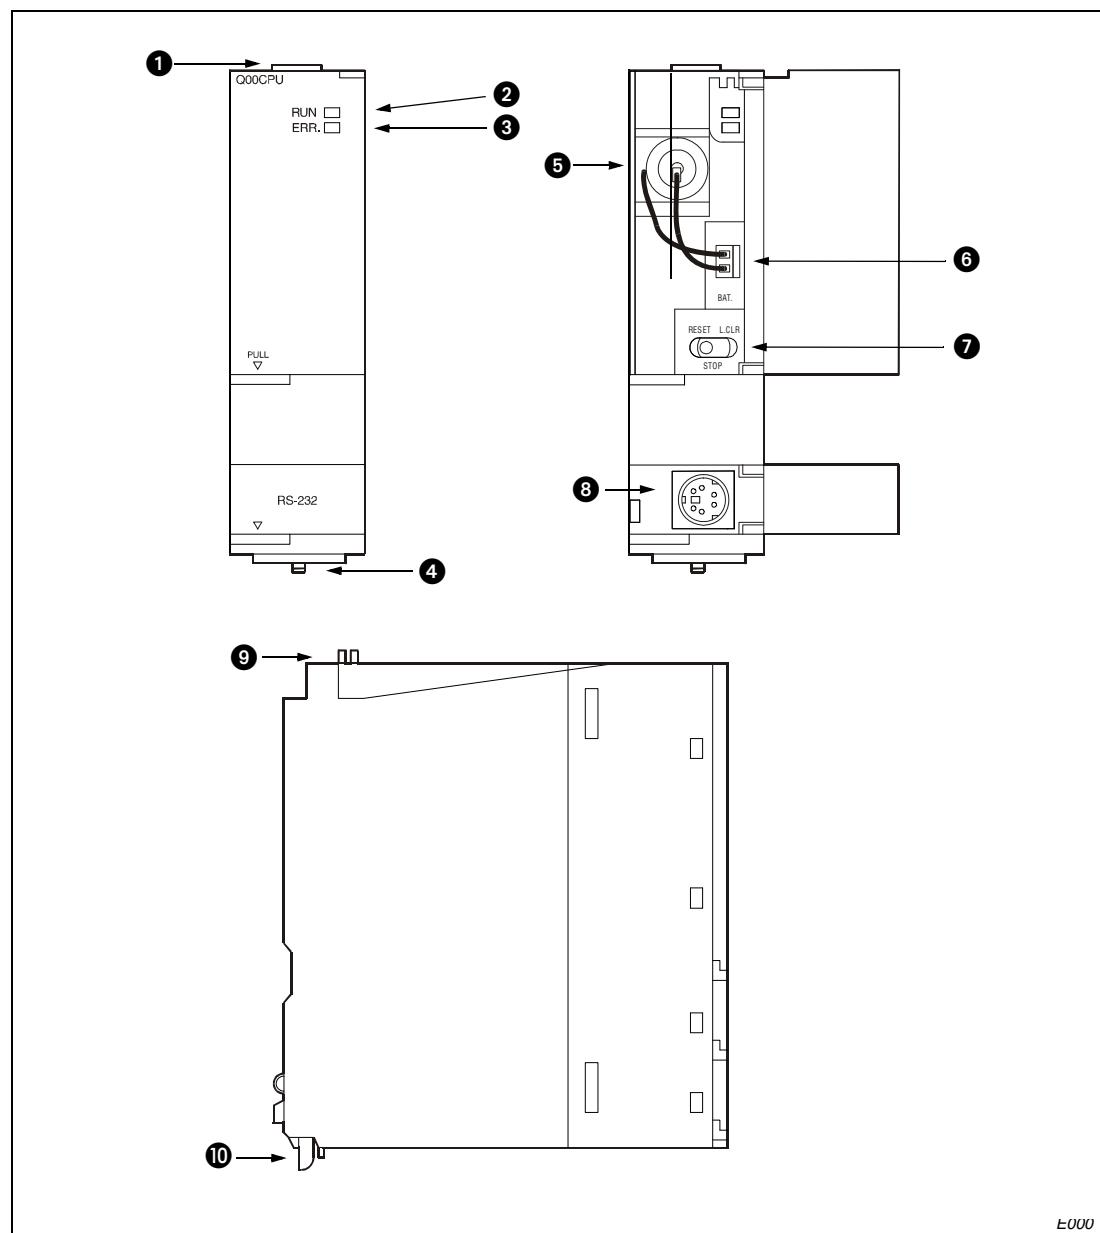

Q00JCPU

**Fig. 4-2:** Part names of Q00JCPU

| No. | Name                  | Application   |
|-----|-----------------------|---|
| ①   | POWER LED             | Power indicator LED for 5 V DC. Turns on in green during normal output of 5 V DC.   |
| ②   | RUN LED               | <p>Indicates the operating status of the CPU module.</p> <ul style="list-style-type: none"> <li>ON: During operation with the RUN/STOP/RESET switch set to "RUN". Executes sequence program operation.</li> <li>OFF: During stop with the RUN/STOP/RESET switch set to "STOP". When an error that stops operation is detected.</li> <li>FLICKER: When parameters/program is written during STOP and the RUN/STOP/RESET switch is moved from "STOP" to "RUN". The CPU is not in "RUN" mode.</li> </ul> <p>To turn on the RUN LED after writing the program/parameters, perform the following operations.</p> <ul style="list-style-type: none"> <li>- Perform reset with the RUN/STOP/RESET switch.</li> <li>- Set the RUN/STOP/RESET switch from "STOP" to "RUN".</li> </ul> <p>To turn on the RUN LED after writing the program/parameters without performing a reset, perform the following operation:</p> <ul style="list-style-type: none"> <li>- Set the RUN/STOP/RESET switch from "STOP" to "RUN" to "STOP" to "RUN".</li> </ul> |
| ③   | ERR. LED              | Error indication <ul style="list-style-type: none"> <li>ON: When the self-diagnostic error that will not stop operation is detected (continuation of operation at error detection must be set in the parameter).</li> <li>OFF: Normal</li> <li>FLICKER: When an error is detected that stops operation.</li> </ul>  |
| ④   | Base mounting hole    | This hole is for fixing the Q00JCPU with a screw.   |
| ⑤   | Battery               | Backup battery for use of the program memory, standard RAM, clock function and backup power time function.  |
| ⑥   | Battery connector pin | For connection of the battery lead wires.<br>Lead wires are disconnected from the connector when shipping to prevent the battery from consuming.  |
| ⑦   | RUN/STOP/RESET switch | <ul style="list-style-type: none"> <li>RUN: Executes sequence program operation.</li> <li>STOP: Stops sequence program operation.</li> <li>RESET: Performs hardware reset, operation error reset, operation initialization or like.</li> </ul>  |
| ⑧   | RS232 connector       | Connector for connecting a programming device (peripheral device) by RS232.   |

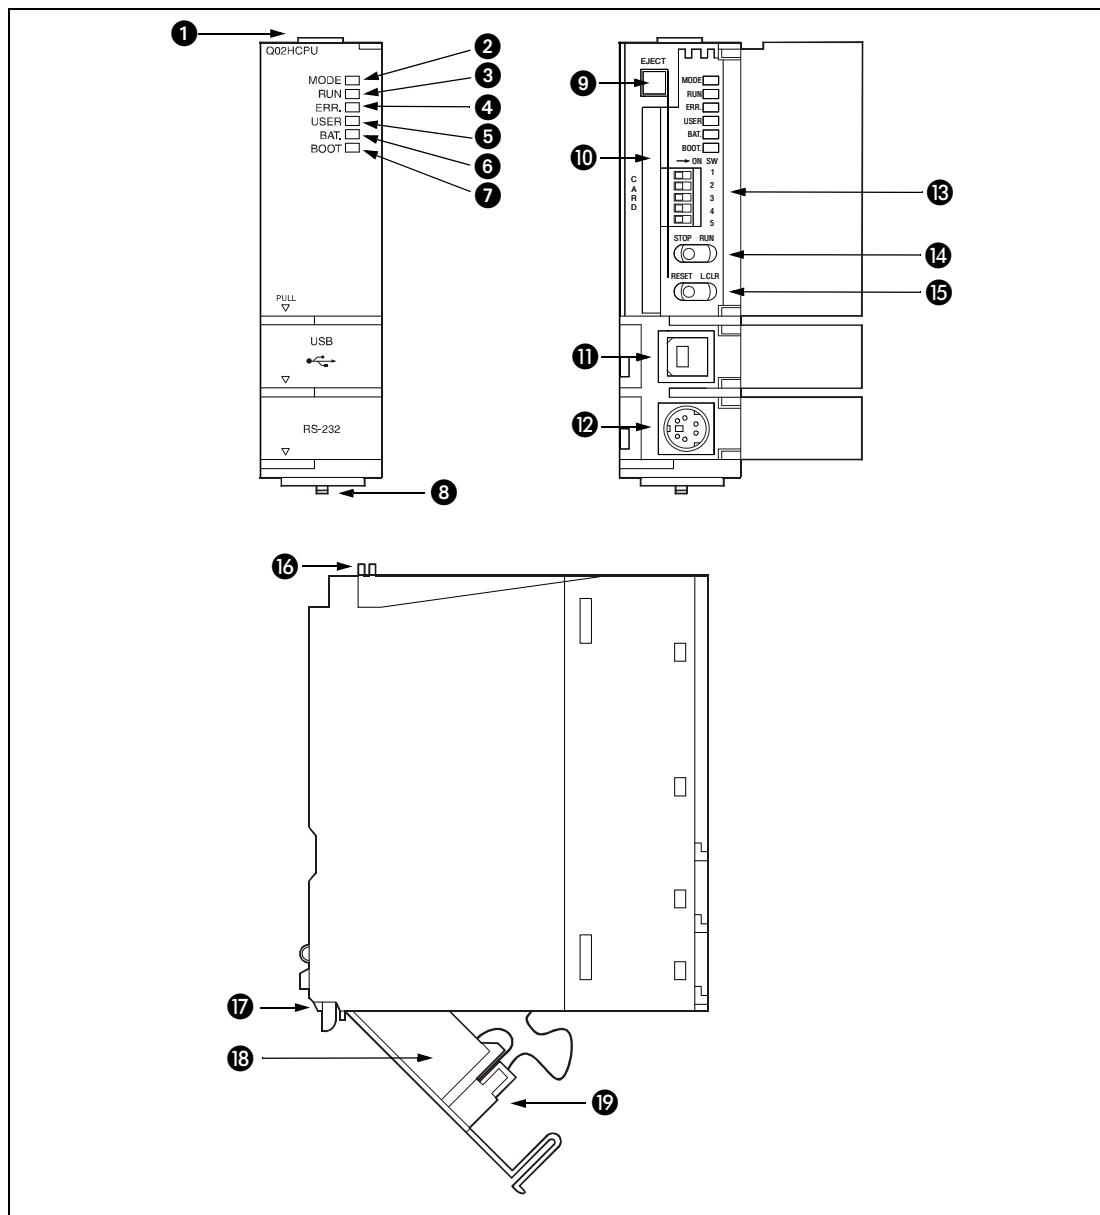

**Tab. 4-13: Part names of Q00JCPU**

**Q00CPU and Q01CPU**

**Fig. 4-3:** Part names of Q00CPU and Q01CPU

| No. | Name                     | Application   |
|-----|--------------------------|---|
| ①   | Module fixing hook       | Hook used to fix the module to the base unit.   |
| ②   | RUN LED                  | <p>Indicates the operating status of the CPU module.</p> <ul style="list-style-type: none"> <li>ON: During operation with the RUN/STOP/RESET switch set to "RUN". Executes sequence program operation.</li> <li>OFF: During stop with the RUN/STOP/RESET switch set to "STOP". When an error that stops operation is detected.</li> <li>FLICKER: When parameters/program is written during STOP and the RUN/STOP/RESET switch is moved from "STOP" to "RUN". The CPU is not in "RUN" mode.</li> </ul> <p>To turn on the RUN LED after writing the program/parameters, perform the following operations.</p> <ul style="list-style-type: none"> <li>- Perform reset with the RUN/STOP/RESET switch.</li> <li>- Set the RUN/STOP/RESET switch from "STOP" to "RUN".</li> </ul> <p>To turn on the RUN LED after writing the program/parameters without performing a reset, perform the following operation:</p> <ul style="list-style-type: none"> <li>- Set the RUN/STOP/RESET switch from "STOP" to "RUN" to "STOP" to "RUN".</li> </ul> |
| ③   | ERR. After performing reset, always return this switch to the neutral position.</li> <li>L.CLR: Latch Clear, used to turn "Off" or clear to "zero" all latch area data set in the parameter.</li> </ul>   |
| ⑯   | Module fixing screw hole         | Hole for the screw used to fix to the base unit (M3x12 screw). (optional).  |
| ⑰   | Module fixing latch              | Latch used to fix the module to the base unit.  |
| ⑱   | Battery                          | Backup battery for use of program memory, standard RAM, clock function and the backup power time function.  |
| ⑲   | Battery connector pin            | For connection of the battery lead wires. Lead wires are disconnected from the connector when shipping to prevent the battery from consuming.   |

**Tab. 4-15: Part names of Q02(H)-, Q06H-, Q12(P)H- and Q25(P)HCPU**

**Q12PRHCPU and Q25PRHCPU**

Compared to the QnHCPU the redundant CPU modules have additional controls (refer to fig. 4-5), which are explained in the following section.

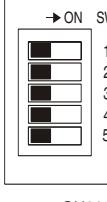

**Fig. 4-5:** Part names of Q12PRHCPU and Q25PRHCPU

| No. | Name               | Application  |
|-----|--------------------|--|
| ①   | BACKUP LED         | <p>Indicates the backup or separate mode while the system is running normally:</p> <ul style="list-style-type: none"> <li>• GREEN: Backup mode</li> <li>• RED: Status in which control (RUN) cannot be continued by system switching.</li> <li>• ORANGE: Separate mode</li> <li>• OFF: Debug mode (e. g. for optimising the program or trouble shooting)</li> </ul> <p>The LED indication is as follows when the memory copy from control system to standby system is executed:</p> <ul style="list-style-type: none"> <li>– LED of the standby system flickers (red or orange) during execution of memory copy, and is on after normal completion.</li> <li>– BACKUP LED of the control system is on (red or yellow) during execution of memory copy and after completion.</li> </ul> |
| ②   | CONTROL LED        | <p>Indicates the CPU module operates as control system or standby system.</p> <ul style="list-style-type: none"> <li>• ON: Control system (the standby system is normal and system switching is available); Debug mode</li> <li>• OFF: Standby system</li> </ul>   |
| ③   | SYSTEM A LED       | <p>System assignment</p> <ul style="list-style-type: none"> <li>• ON: System A or debug mode.</li> <li>• FLICKER: When the tracking cable is disconnected while the system runs normally as the system A (keeps on flickering until the system A side tracking cable is connected).</li> <li>• OFF: System B (LED "SYSTEM B" LED turns on)</li> </ul>  |
| ④   | SYSTEM B LED       | <p>System assignment</p> <ul style="list-style-type: none"> <li>• ON: System B or debug mode.</li> <li>• FLICKER: When the tracking cable is disconnected while the system runs normally as the system B (keeps on flickering until the system B side tracking cable is connected).</li> <li>• OFF: System A ("SYSTEM A" LED turns on.)</li> </ul>   |
| ⑤   | TRACKING connector | For data transfer both redundant PLCs are connected with a tracking cable.   |

**Tab. 4-16:** Part names of Q12PRHCPU and Q25PRHCPU

#### 4.4.2 DIP switches

The DIP switches are used for setting the system protection and the valid parameter drives for CPU types Q02, Q02H, Q06H, Q12H, Q12P(R)H, Q25H and Q25P(R)H. All switches are preset to off as factory default. Switches SW4 and SW5 must not be used (without function).

| DIP switches  | SW1   | SW2  | SW3        |
|---|---|--|------------|
|  | <p>System protection</p> <ul style="list-style-type: none"> <li>• OFF: No protection</li> <li>• ON: Protection</li> </ul> | Parameter-valid drive<br>Parameters cannot be stored in standard RAM (Drive 3) |            |
|   |   | <b>SW2</b>   | <b>SW3</b> |
|   |   | OFF  | OFF        |
|   |   | ON   | OFF        |
|   |   | OFF  | ON         |
|   |   | ON   | ON         |

**Tab. 4-17:** DIP switches

#### 4.4.3 Transfer of a program with a programming device

**NOTE**

Before writing a program to the CPU module, set the system protect setting switch (DIP switch: SW1) of the CPU module to off (not protected). Enter the correct password, if the CPU is password secured.

**When writing a program with CPU module set to "STOP"**

When writing a program with the CPU placed in the STOP status, operate the switches in the following procedure:

- To set to RUN status with device memory data cleared:

① Set the RESET/L.CLR switch resp. the RUN/STOP/RESET switch to the RESET position once and return it to the original neutral position.

② Set the mode switch to RUN position.

The CPU module is placed in the RUN status (RUN LED: On).

- To set to RUN status with device memory data **not** cleared (held):

① Set the mode switch (RUN/STOP switch or RUN/STOP/RESET switch) to RUN position.

The RUN LED flashes.

② Set the mode switch to "STOP" position.

③ Set the mode switch to "RUN" position again.

The CPU module is placed in the RUN status (RUN LED: On).

**NOTES**

When a program was written to the program memory during boot operation, also write the program to the boot source memory. If the program is not written to the boot source memory, the old program will be executed at the next boot operation.

If the CPU is stopped and restarted by the programming device after program transfer, no operation is needed for the switches of the CPU module.

**When writing a program while CPU module is running**

When a program is written while CPU module is running, no operation is needed for the switches of the CPU module.

At this time, the device memory data are not cleared.

**NOTE**

While the CPU module is running (RUN status) program changes are done in the program memory.

When a program was written to the program memory while CPU module is running, also write the program to the boot source memory. If the program is not written to the boot source memory, the old program will be executed at the next boot operation.

#### 4.4.4 Latch clear operation

Latch clear (switch off or set to 0) can be performed for stored Latch data set by parameters.

**NOTE**

The valid/invalid for latch clear in the clear range of latch clear operation can be set for each device. The setting can be made in the device setting of the PLC parameter.

**Q00JCPU, Q00CPU and Q01CPU**

The CPU modules Q00J, Q00 and Q01 are not equipped with a switch for latch clear operation. Latch clear can only be performed by the remote latch clear operation of GX (IEC) Developer.

**Q02CPU, Q02HCPU, Q06HCPU, Q12(P)(R)HCPU, Q25(P)(R)HCPU**

To perform latch clear, operate the switches in the following procedure:

- ① Set the RUN/STOP switch to "STOP".
- ② Set the RESET/L.CLR switch to the L.CLR position several times until the USER LED flashes (ready for latch clear).
- ③ Set the RESET/L.CLR switch to the L.CLR position one more time.

The USER LED turns off (latch clear complete).

**NOTE**

In addition to the way of using the RESET/L.CLR switch for latch clear, remote latch clear may be performed from GX (IEC) Developer.

#### 4.4.5 Data transfer from memory card to standard ROM

- ① Power off the programmable controller.
- ② Insert the memory card that contains the parameters and programs to be booted onto the CPU module.
- ③ Set the DIP switches on the CPU module (section 4.4.2) so that the valid parameter drive is matched with the memory card to be installed.  
When a SRAM card is installed: SW2: On, SW3: Off  
When a Flash card/ATA card is installed: SW2: Off, SW3: On
- ④ Power on the programmable controller.
- ⑤ The BOOT LED will flash when automatic write to standard ROM is completed.
- ⑥ Turn off the programmable controller.
- ⑦ Remove the memory card, and then set the valid parameter drive to the standard ROM with the CPU module's DIP switches.  
Standard ROM: SW2: On, SW3: On

The parameters and programs will be booted from the standard ROM to the program memory when the programmable controller is turned on to enable actual operations.

**NOTE**

The Data transfer from memory card to standard ROM can be selected in the programming software GX Developer or GX IEC Developer.

## 4.5 Part names and settings of universal CPU modules

### 4.5.1 Part names of CPU modules

Q00UJCPU

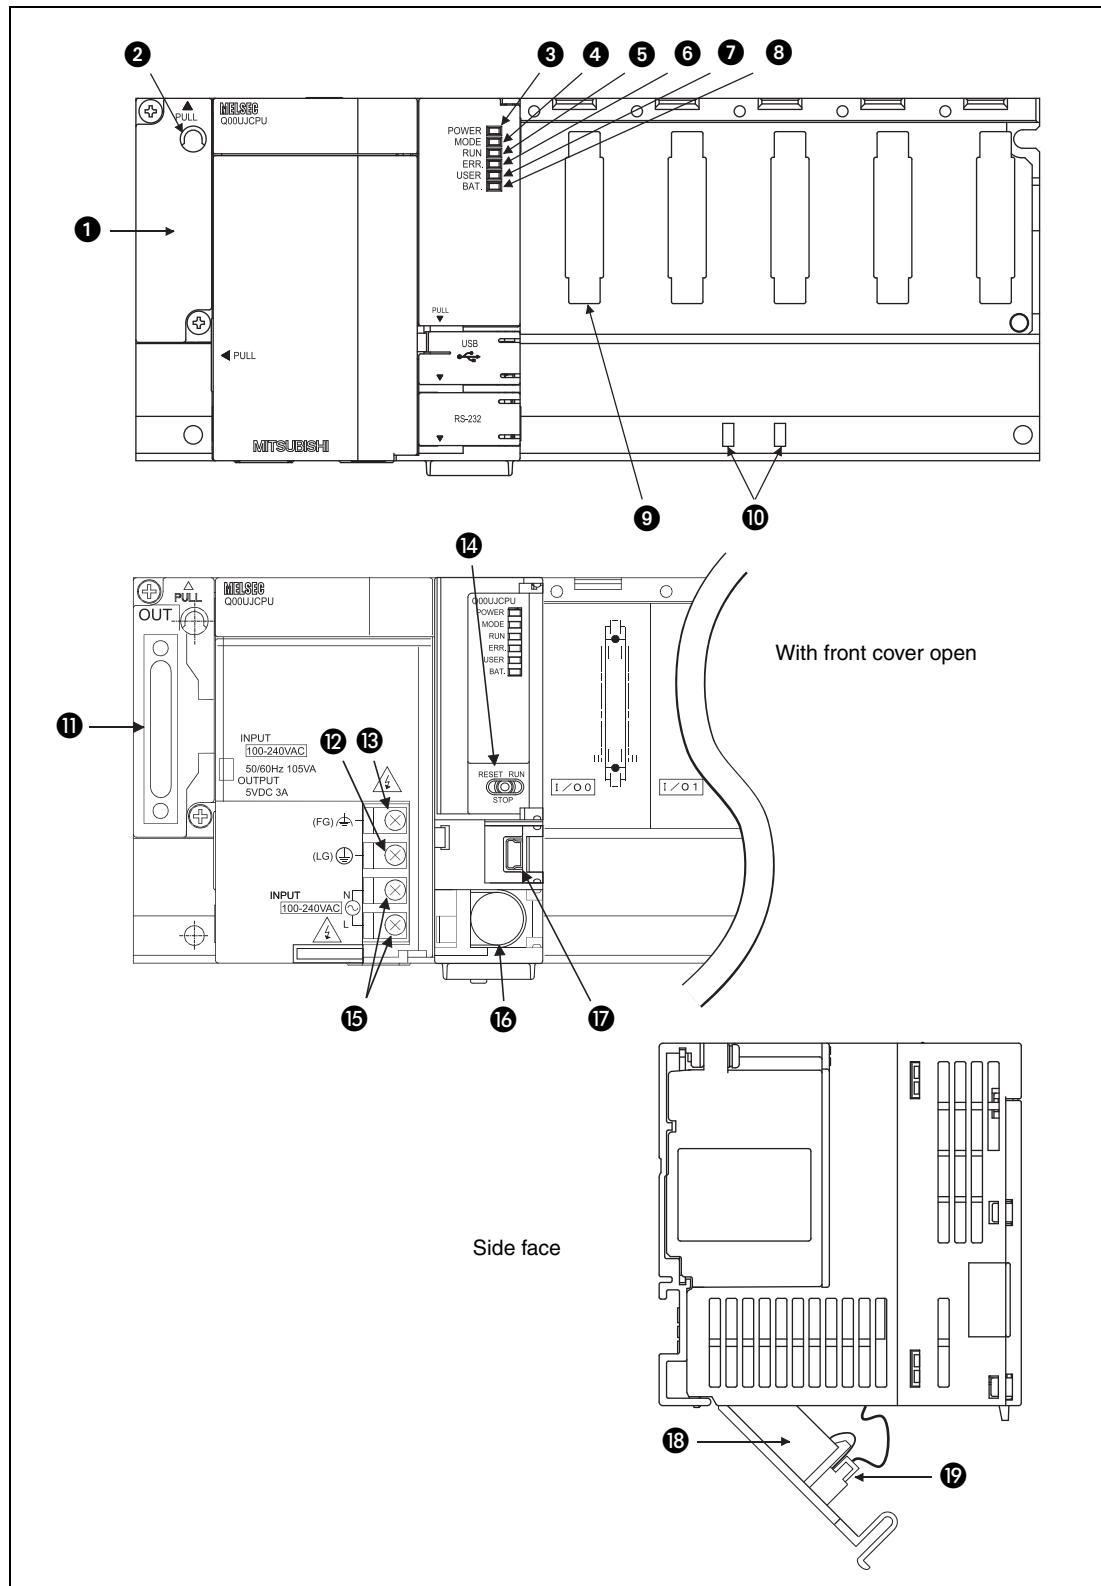

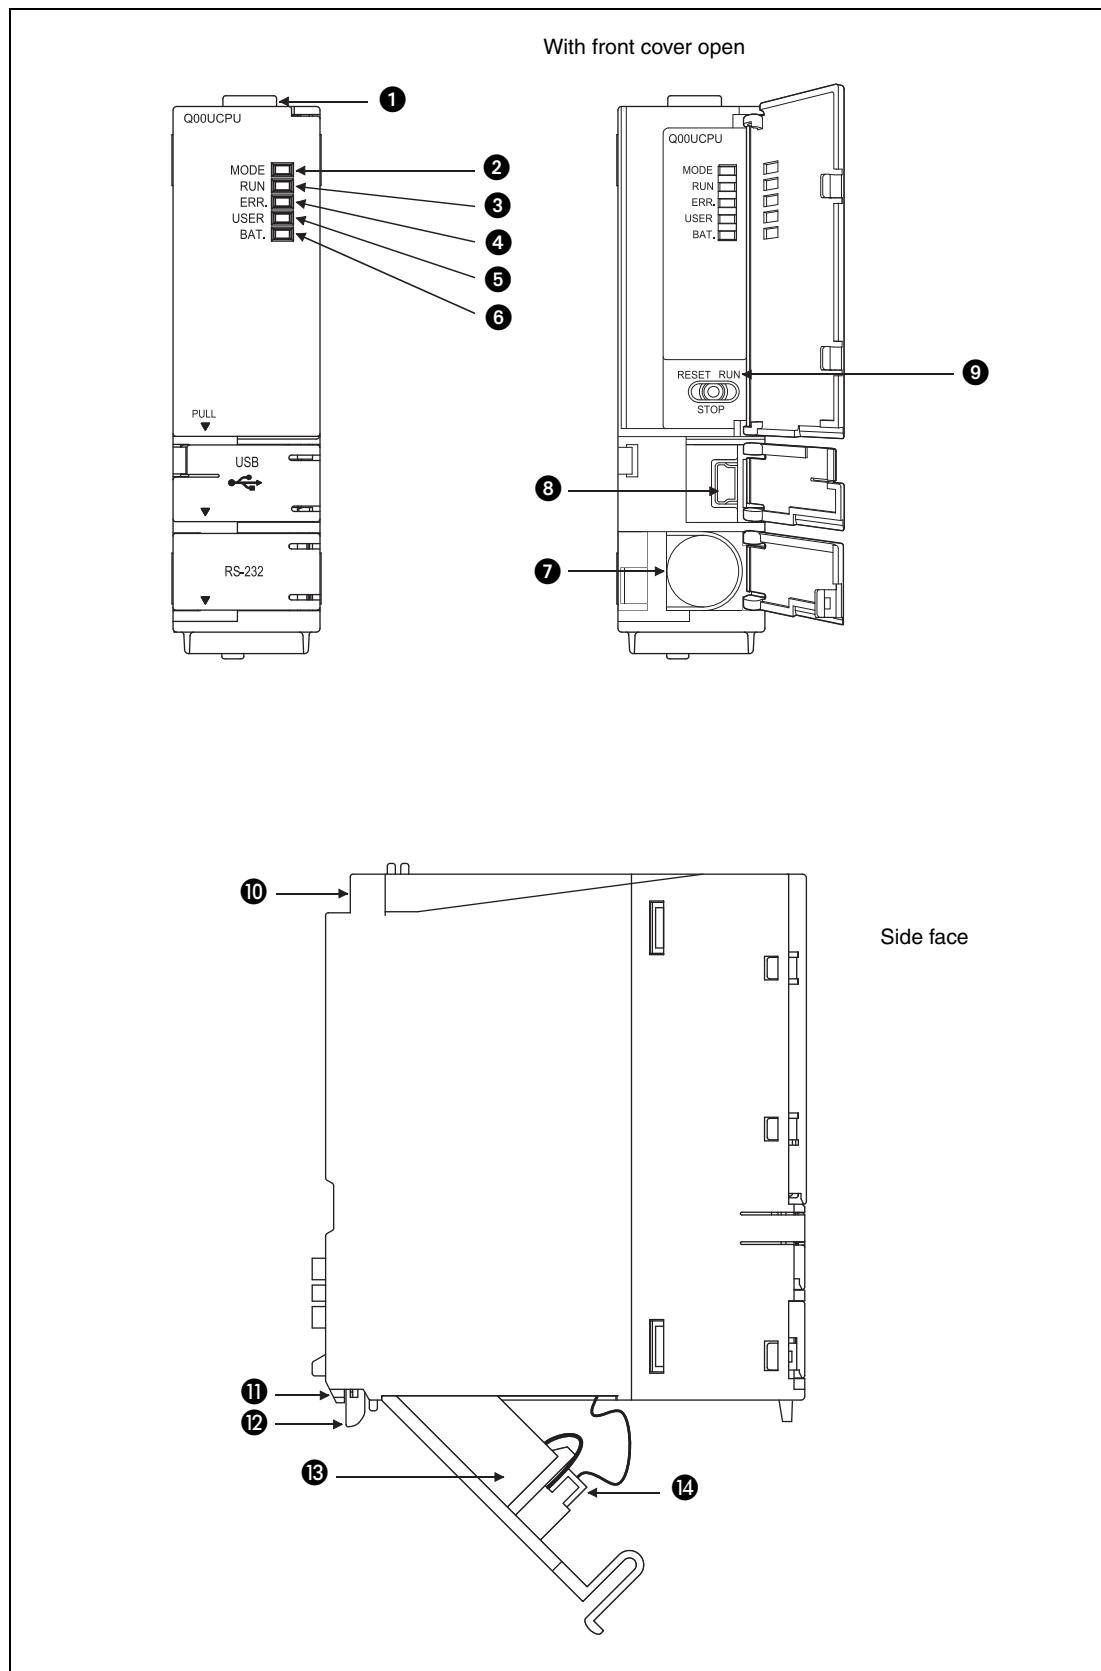

Fig. 4-6: Part names of Q00UJCPU

| No. | Name                                     | Application   |
|-----|--|---|
| ①   | Cover for extension cable connector      | Protective cover for extension cable connector.<br>Remove this cover when connecting an extension base unit.  |
| ②   | Base mounting hole ( $\varnothing$ 5 mm) | Fixing holes (M4) for the base unit when not mounting on a DIN rail.  |
| ③   | POWER LED                                | Power indicator LED for 5 V DC.<br>Turns on in green during normal output of 5 V DC.  |
| ④   | MODE LED                                 | Indicates the mode of the CPU module <ul style="list-style-type: none"> <li>• ON: Q mode</li> <li>• OFF: <ul style="list-style-type: none"> <li>– Executational conditioned device test in process</li> <li>– Forced on/off of external devices in process</li> </ul> </li> </ul>   |
| ⑤   | RUN LED                                  | Indicates the operating status of the CPU module. <ul style="list-style-type: none"> <li>• ON: The PLC operates the program with cyclic processing (RUN status).</li> <li>• OFF: During stop with the RUN/STOP/RESET switch set to "STOP". When an error that stops operation is detected.</li> <li>• FLICKER: When parameters or a program is written during STOP and the RUN/STOP/RESET switch is moved from "STOP" to "RUN". The CPU is not in "RUN" mode.</li> </ul> <p>To turn on the RUN LED after writing the program, perform the following operations:</p> <ul style="list-style-type: none"> <li>– Shift the RUN/STOP/RESET switch from "RUN" to "STOP" to "RUN".</li> <li>– Perform reset with the RUN/STOP/RESET switch (refer to section 4.5.3).</li> <li>– Power on the programmable controller again.</li> </ul> <p>To turn on the RUN LED after writing the parameters, perform the following operations.</p> <ul style="list-style-type: none"> <li>– Perform reset with the RUN/STOP/RESET switch.</li> <li>– Power on the programmable controller again.</li> </ul> <p>(If the RUN/STOP/RESET switch is shifted from "STOP" to "RUN" to "STOP" to "RUN" after changing the parameter values, the new values are not reflected on the parameters related to the intelligent function module, such as the network parameters.)</p> |
| ⑥   | ERR. LED                                 | Error indication <ul style="list-style-type: none"> <li>• ON: When the self-diagnostic error that will not stop operation is detected (continuation of operation at error detection must be set in the parameter).</li> <li>• OFF: Normal</li> <li>• FLICKER: <ul style="list-style-type: none"> <li>– When an error that stops operation is detected.</li> <li>– When reset operation is performed with the RUN/STOP/RESET switch.</li> </ul> </li> </ul>  |
| ⑦   | USER LED                                 | Display of user messages: <ul style="list-style-type: none"> <li>• ON: Announcer (F) turned on.</li> <li>• OFF: Normal</li> </ul>   |
| ⑧   | BAT. LED                                 | Display of user messages: <ul style="list-style-type: none"> <li>• ON (green): Turned on for 5 seconds after restoring of data backed up to the standard ROM by the latch data backup is completed.</li> <li>• FLICKER (green): Flashes when backup of data to the standard ROM by latch data backup is completed.</li> <li>• FLICKER (yellow): Battery error due to voltage drop of the CPU module battery.</li> <li>• OFF: Normal</li> </ul>  |
| ⑨   | Module connector                         | Connector used for mounting an I/O or intelligent function module.<br>To the connector of the spare space where no module is mounted, fit the accessory connector cover or the blank cover module (QG60) to prevent dust from entering)   |
| ⑩   | DIN rail adapter mounting holes          | Holes for mounting a DIN rail adapter.  |
| ⑪   | Extension cable connector                | Connector for transferring signals to or from the extension base unit. Connect an extension cable.  |
| ⑫   | LG terminal                              | Power filter ground   |
| ⑬   | FG terminal                              | Ground terminal connected with the shield pattern of the printed circuit board.   |
| ⑭   | RUN/STOP/RESET switch                    | <ul style="list-style-type: none"> <li>• RUN: Executes sequence program operation.</li> <li>• STOP: Stops sequence program operation.</li> <li>• RESET: Performs hardware reset, operation error reset, operation initialization or like.</li> </ul>  |

**Tab. 4-20:** Part names of Q02UCPU, Q03UD(E)CPU and Q□UD(E)HCPU

## 4.5.2 Transfer of a program with a programming device

### When writing a program with CPU module set to "STOP"

When writing a program with the CPU placed in the STOP status, operate the switches in the following procedure:

- To set to RUN status with device memory data cleared:
  - ① Set the RUN/STOP/RESET switch to the RESET position once (approx. 1 second) and return it to the STOP position.
  - ② Set the mode switch to RUN position.  
The CPU module is placed in the RUN status (RUN LED: On).
- To set to RUN status with device memory data **not** cleared (held):
  - ① Set the mode switch (RUN/STOP/RESET switch) to RUN position.  
The RUN LED flashes.
  - ② Set the mode switch to "STOP" position.
  - ③ Set the mode switch to "RUN" position again.  
The CPU module is placed in the RUN status (RUN LED: On).

#### NOTES

When a program was written to the program memory during boot operation, also write the program to the boot source memory. If the program is not written to the boot source memory, the old program will be executed at the next boot operation.

If the CPU is stopped and restarted by the programming device after program transfer, no operation is needed for the switches of the CPU module.

### When writing a program while CPU module is running

When a program is written while CPU module is running, no operation is needed for the switches of the CPU module.

At this time, the device memory data are not cleared.

#### NOTE

While the CPU module is running (RUN status) program changes are done in the program memory.

When a program was written to the program memory while CPU module is running, also write the program to the boot source memory. If the program is not written to the boot source memory, the old program will be executed at the next boot operation.

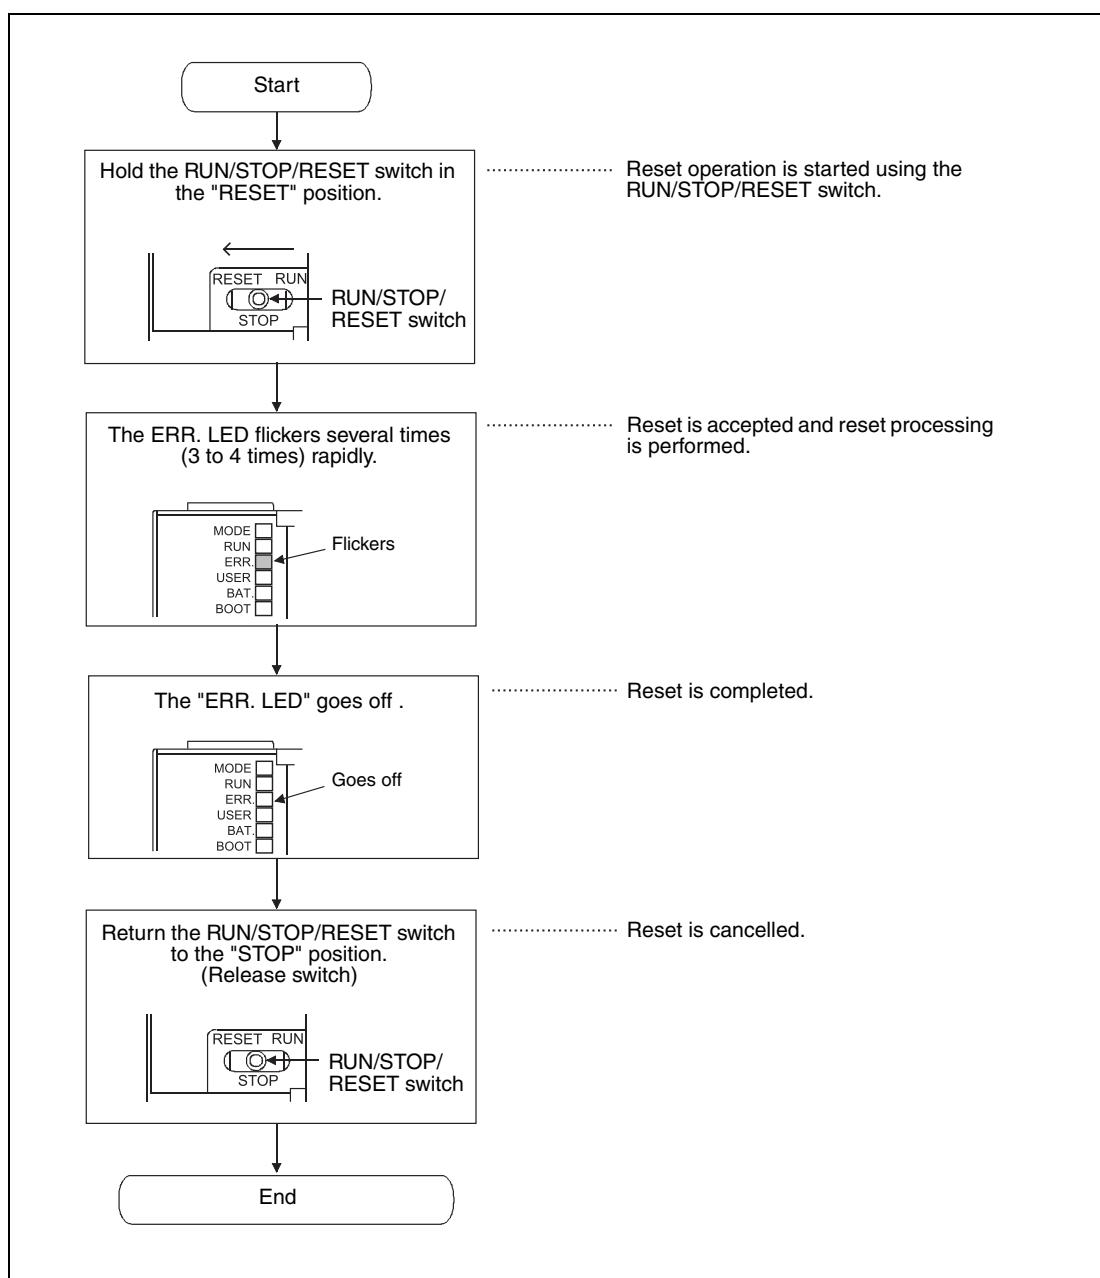

### 4.5.3 Reset operation

For the Universal model QCPU, the RUN/STOP/RESET switch of the CPU module is used to switch between the RUN status and STOP status and to perform RESET operation. Moving the RUN/STOP/RESET switch to the reset position will not reset it immediately.

#### NOTES

- Hold the RUN/STOP/RESET switch in the RESET position until reset processing is complete (the flashing ERR. LED turns off). If you release your hand from the RUN/STOP/RESET switch during reset processing (the ERR. LED is flashing), the switch will return to the STOP position and reset processing cannot be completed.
- Operate the RUN/STOP/RESET switch with your fingertips. To prevent the switch from being damaged, do not use any tool such as screw driver.

Perform reset operation with the RUN/STOP/RESET switch as shown in following figure:

**Fig. 4-10: Reset operation for Universal model QCPU**

#### 4.5.4 Latch clear operation

Latch clear (switch off or set to 0) can be performed for stored Latch data set by parameters.

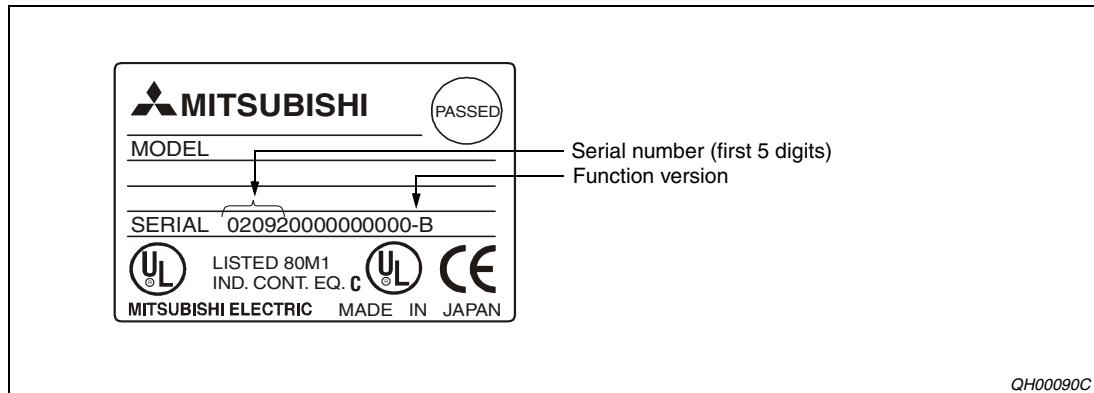

**NOTE**

The valid/invalid for latch clear in the clear range of latch clear operation can be set for each device. The setting can be made in the device setting of the PLC parameter.

The Universal model QCPUs are not equipped with a switch for latch clear operation. Latch clear can only be performed by the remote latch clear operation of GX (IEC) Developer.

## 4.6 Checking serial number and function version of the CPU module

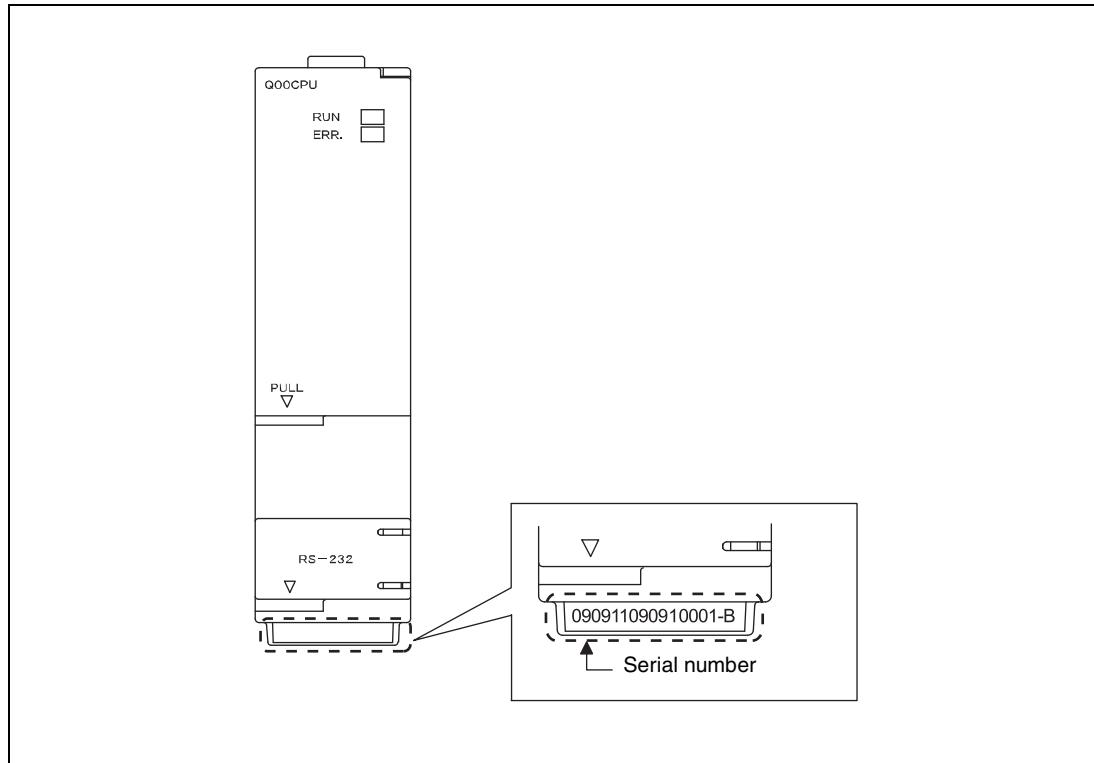

Certain functions and features, such as the memory capacity of the standard RAM, are determined by the serial number and the function version of the CPU. The serial number and function version of the CPU module can be checked on the rating plate located on the side face of the module:

**Fig. 4-11: Rating plate**

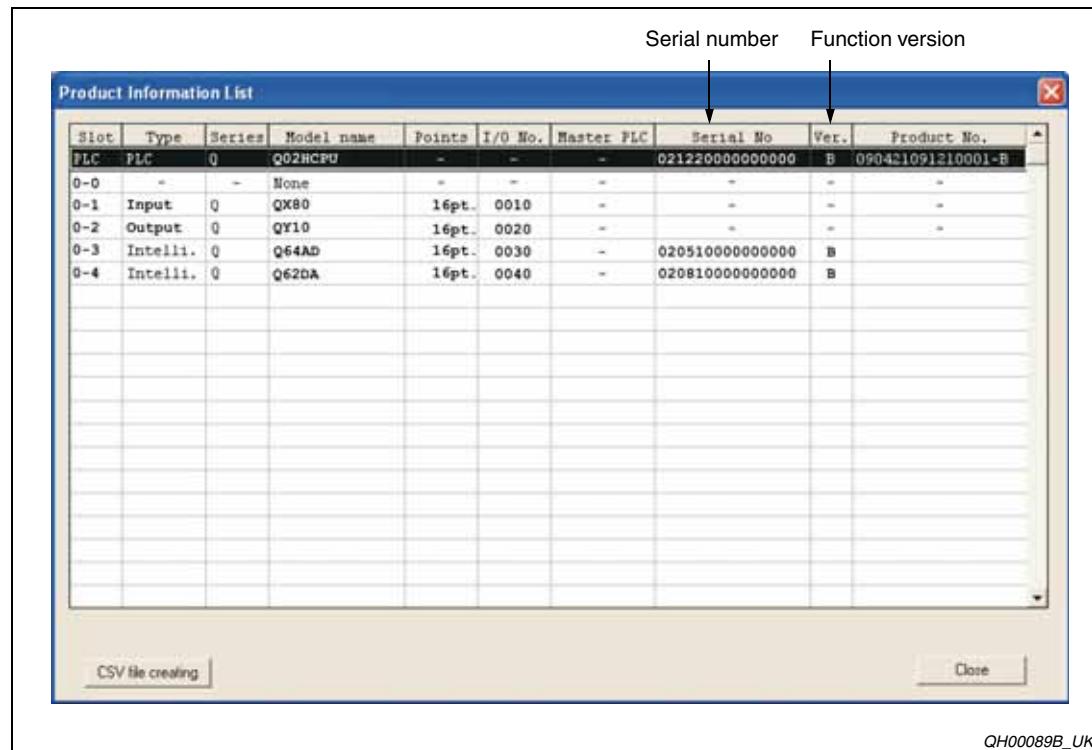

The serial number is shown on the rating plate located on the front of the module. This does not apply to the following CPU modules:

- Modules manufactured in mid-September 2007 or earlier.
- Redundant CPUs and Q00JCPU.

**Fig. 4-12: Serial number display on the front of the module**

The informations may also be checked using a programming device and the programming software GX Developer (Version 6 or later) or GX IEC Developer during CPU operation. To display the screen for checking the serial number and function version, select [Diagnostics] [System monitor] and click the **Product Inf. List** button.

**Fig. 4-13: Product information list**

On the screen, the serial number and function version of intelligent function modules can also be checked.

# 5 Memory cards and batteries

## 5.1 Memory card

All CPU types of MELSEC System Q except Q00(U)JCPU, Q00(U)CPU and Q01(U)CPU are equipped with a memory card slot. There are battery buffered RAM Memory cards (reading and writing by CPU) and permanent ROM memory cards (only readable by CPU) available.

| Memory card                 | CPU module   |  |                        |                                |  |

**Tab. 5-2:** Memory card specifications

- ① after formatting
- ② For ATA card when the manufacturer control number is D or earlier
- ③ For ATA card when the manufacturer control number is E
- ④ For ATA card when the manufacturer control number is F or later

### The manufacturer control number of ATA cards

The manufacturer control number of the ATA card is written on the label on the back of the ATA card. When character string including the manufacturer control number is 4 digits, the third digit from the leftmost is the manufacturer control number.

**Fig. 5-1:**  
Manufacturer control number of ATA cards

When character string is 3 digits, the manufacturer control number is "B".

### ATA card memory size indication in special register SD603

When the ATA card is used, the value stored in the special register SD603 indicates the memory size and differs depending on the manufacturer control number and CPU module type.

When the CPU module is the Universal model QCPU, the ATA card size is stored in SD603 in units of K bytes.

When the module is not the Universal model QCPU, 8000, 16000, or 32000 is stored in SD603 and the value depends on the manufacturer control number and CPU module type

| Memory card | Manufacturer control No. | Value stored in special register SD603                     |   |                       |
|-------------|--------------------------|--|---|-----------------------|
|             |                          | High performance model QCPU, Process CPU and Redundant CPU |   | Universal model QCPU  |
|             |                          | Serial No. (first 5 digits) is 09011 or earlier            | Serial No. (first 5 digits) is 09012 or later |                       |
| Q2MEM-8MBA  | "D" or earlier           | 8000   | 8000  | ATA card size [kByte] |
|             | "E"                      | 16000  | 8000  |                       |
|             | "F" or later             | 32000  | 16000   |                       |
| Q2MEM-16MBA | "D" or earlier           | 16000  | 16000   | ATA card size [kByte] |
|             | "E"                      | 16000  | 16000   |                       |
|             | "F" or later             | 32000  | 32000   |                       |
| Q2MEM-32MBA | "D" or earlier           | 32000  | 32000   | ATA card size [kByte] |
|             | "E"                      |  |   |                       |
|             | "F" or later             |  |   |                       |

**Tab. 5-3:** Memory size indication in special register SD603

## 5.1.2 Handling the memory card

### Formatting of memory card

Any SRAM or ATA card must have been formatted to use in the CPU module. Since the SRAM or ATA card purchased is not yet formatted, format it using GX (IEC) Developer before use. Formatting is not necessary for Flash cards.

#### NOTE

Do not format an ATA card other than by GX Developer or GX IEC Developer.  
(If formatted using format function of Microsoft® Windows®, the ATA card may not be usable in a CPU module.)

### SRAM card battery

A battery used to backup for power failure is supplied with the SRAM cards Q2MEM-1MBS, Q2MEM-2MBS, Q3MEM-4MBS and Q3MEM-8MBS.

Before using the SRAM card, install the battery.

#### NOTES

The battery of the CPU does not buffer the SRAM memory card, when the power supply is shut off. Use a separate battery for the memory card.

The battery of the memory card does **not** buffer the data of the program memory and internal RAM of the CPU, when the power supply is shut off. Install a separate battery, to buffer these memory areas.

### Types of files which can be stored on memory card

For the types of the files that can be stored on each memory card, refer to the manuals of the CPU modules used.

### Errors when the installation of the memory card is wrong

Poor insertion of the memory card may result in "ICM.OPE.ERROR".

If the CPU module operation for an error is set to "Stop" in the Parameters, the CPU module stops its operation upon the occurrence of "ICM.OPE.ERROR".

### Increase of scanning time when the memory card is installed

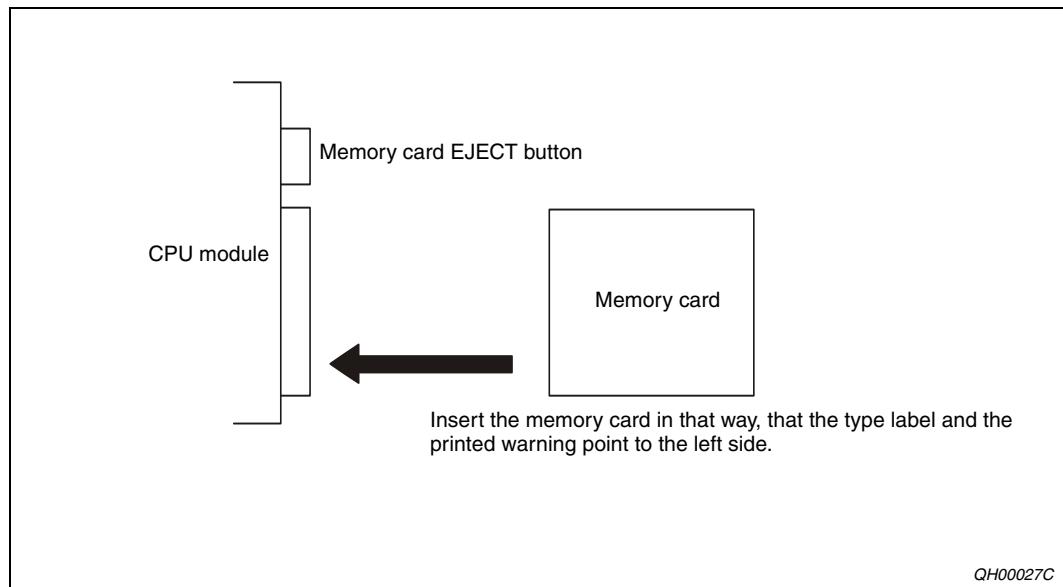

When the memory card is installed, the scanning time is increased by several 10 ms max. 1 scan is only added, when the CPU module executes mount processing.

### 5.1.3 Installing and removing a memory card

#### Memory cards Q2MEM-1MBS and Q2MEM-2MBS

- Installation

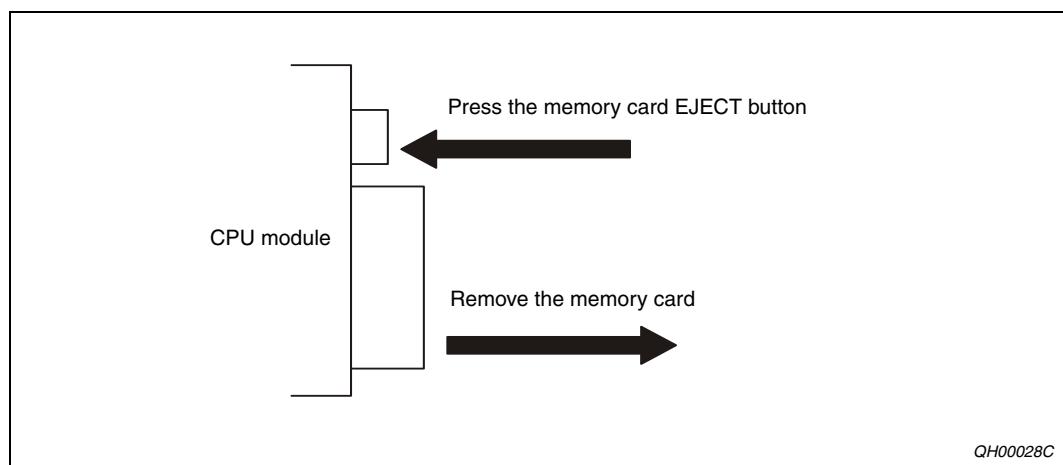

The installation of the memory card is possible, when the power supply of the CPU is on. Install the memory card into the CPU module, while paying attention to the orientation of the memory card. Insert the memory card securely into the connector until the height of the memory card reaches that of the memory card EJECT button (refer to sections 4.4.1 and 4.5.1).

**Fig. 5-2:** Install the memory card

- Removal

When removing the memory card from the CPU module, press the memory card EJECT button to pull out the memory card (refer to sections 4.4.1 and 4.5.1). Using plastic tweezers to pull out the memory card is effective when the memory card cannot be removed smoothly.

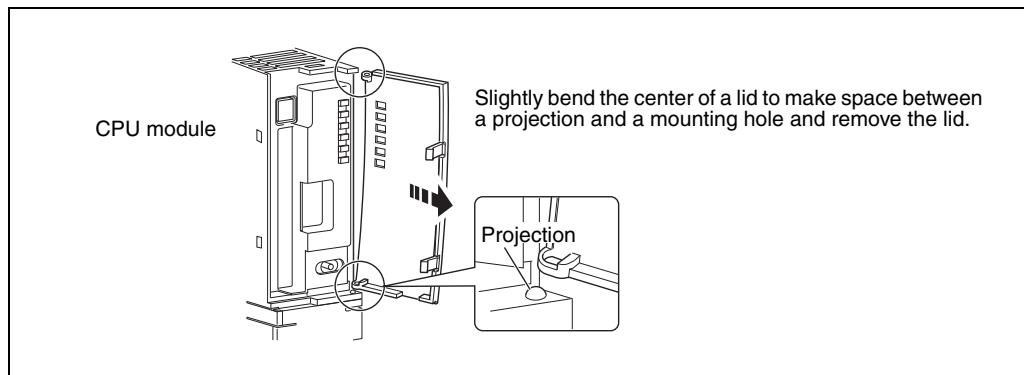

**Fig. 5-3:** Remove the memory card

### Memory cards Q3MEM-4MBS and Q3MEM-8MBS

- Installation

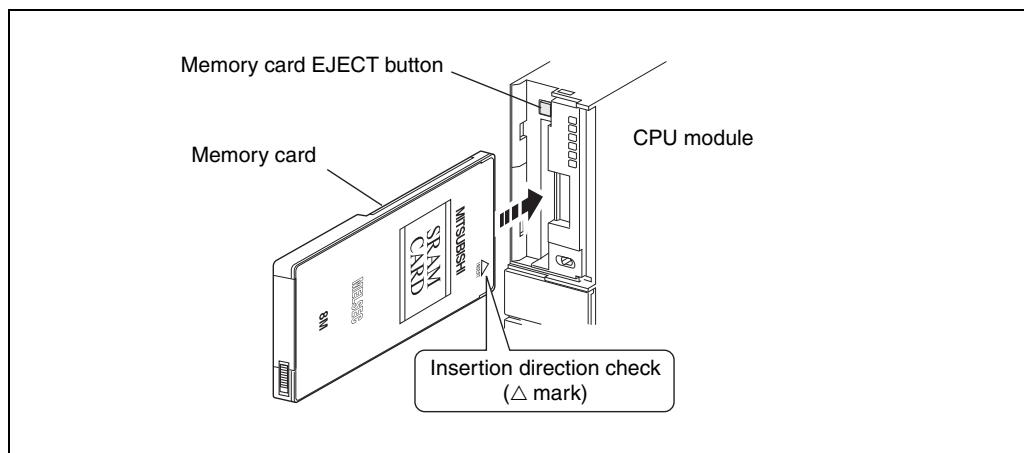

After installation the memory cards Q3MEM-4MBS and Q3MEM-8MBS stick out of the CPU module main body. Therefore the lid of the CPU module must be removed and a memory card protective cover has to be set to the CPU module after installation.

- ① Turn OFF power supply of the CPU module and remove the lid of the CPU module main body.

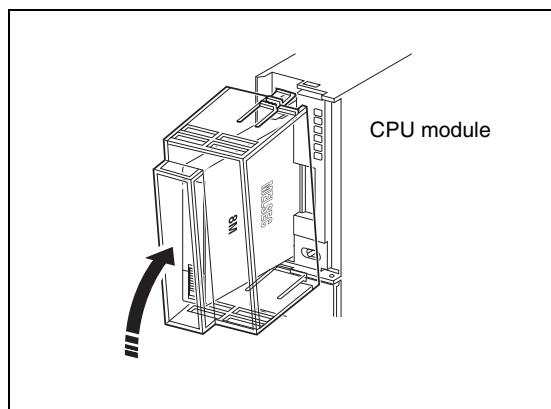

**Fig. 5-4:** Remove the lid

- ② Install a memory card to a memory card slot of the CPU module main body.

**Fig. 5-5:** Installing a memory card

- ③ Set a memory card protective cover to the CPU module

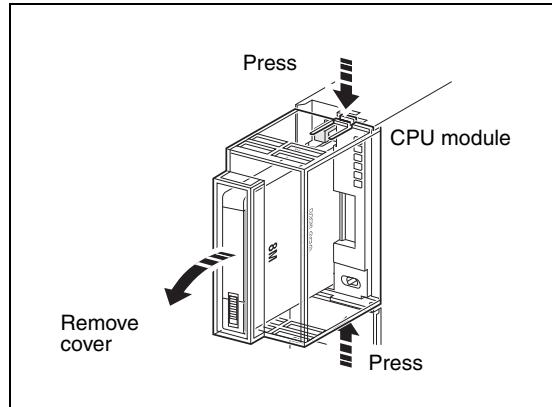

**Fig. 5-6:**

The cover protects the ATA memory card, sticking out of the CPU module main body.

- Removal

When removing a memory card Q3MEM-4MBS or Q3MEM-8MBS from the CPU module main body, the memory card protective cover must be removed.

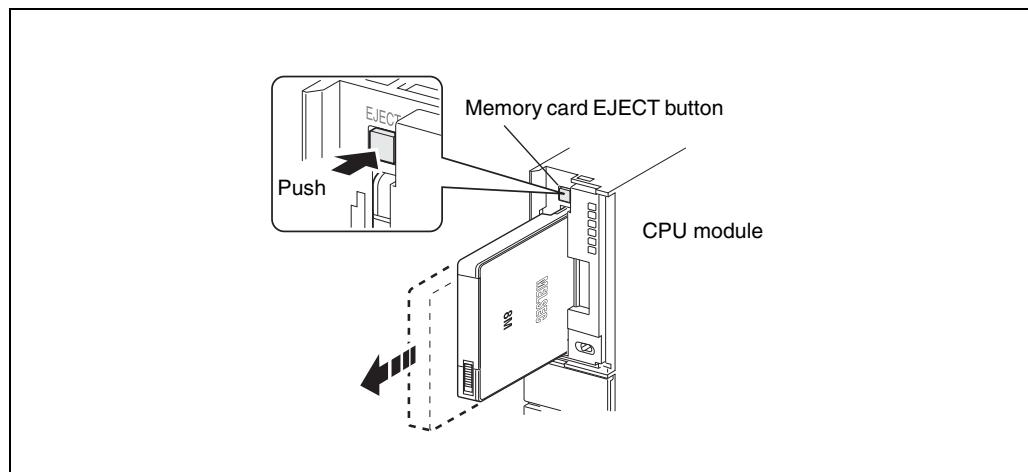

- ① Turn OFF power supply of the CPU module and remove a memory card protective cover from the CPU module.

**Fig. 5-7:**

To remove a memory card protective cover, press fixing claws of top/bottom.

- ② Press the EJECT button to eject a memory card (refer to sections 4.4.1 and 4.5.1).

**Fig. 5-8:** Removing a memory card

**To remove the memory card during power on**

Special relays of the CPU indicate, if a memory card is installed and if it can be removed:

- SM600 = 1: Memory card can be used.  
SM600 = 0: Memory card cannot be used.

The special relay SM600 is set by the system, when the memory card is installed and ready to use.

- SM604 = 1: Memory card is being used.  
SM604 = 0: Memory card is not being used.

When accessing the memory card by the CPU module the system sets or resets the special relay SM604.

- SM605 = 1: Memory card removal/insertion prohibited.  
SM605 = 0: Memory card removal/insertion allowed.

SM605 is turned on/off by the user.

- SM609 = 1: Memory card is being removed.  
SM609 = 0: Memory card removal prohibited.

SM609 has to be set by the user before removing the memory card and will be reset by the operating system of the CPU after removing the memory card.

Keep the following sequence when removing the memory card with power supply on:

- ① Turn off "SM605" if it is on.
- ② Turn on the special relay "SM609" using the sequence program or the programming device.
- ③ Check the special relays SM600 and SM604 with the programming device, if they are reset.
- ④ Remove the memory card.

**NOTE**

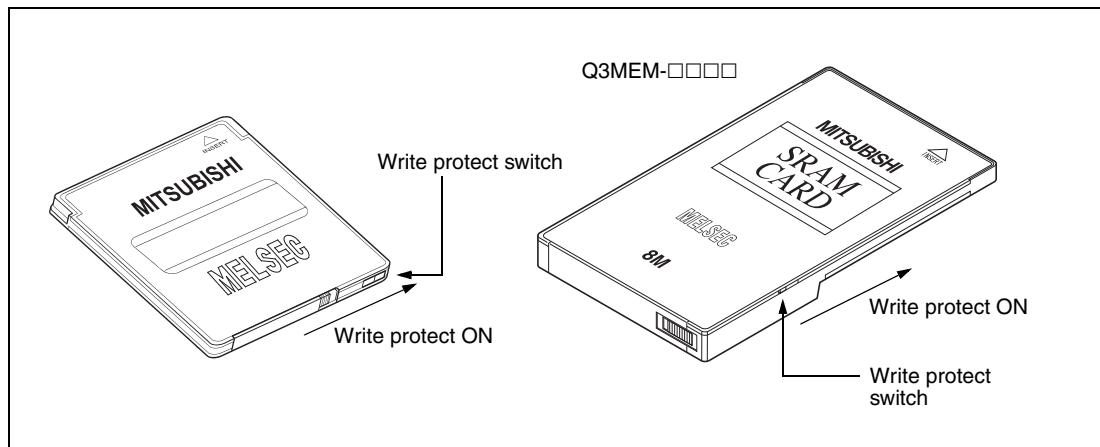

Note that the data in the memory card may be damaged if the above mentioned procedures are not performed correctly.

Poor insertion of the memory card may result in "ICM.OPE.ERROR". Also, if the CPU module operation for an error is set to "Stop" in the Parameters, the CPU module stops its operation upon the occurrence of "ICM.OPE.ERROR".

### 5.1.4 Setting the write protect switch

The data of the SRAM and FlashROM memory card can be protected against erasing with the write protect switch.

After shipping, the write protection of the memory card is switched off, so that changing of data is possible all the time.

**Fig. 5-9:** Write protect switch of memory cards

## 5.2 Batteries

The specified life of the battery does not depend on the current consumption. Replace the battery always after this time even if there was no voltage failure during this time (refer to section 10.3.1).

### 5.2.1 Battery specifications

| Item                     | Q6BAT   | Q7BAT*   | Q2MEM-BAT                                     | Q3MEM-BAT                                     |
|--------------------------|---|----------|---|---|
| Classification           | Manganese dioxide lithium primary battery   |          |   |   |
| Initial voltage          | 3.0 V   | 3.0 V    | 3.0 V   | 3.0 V   |
| Capacity                 | 1800 mAh  | 5000 mAh | 48 mAh  | 550 mAh                                       |

**Tab. 5-4: Battery specifications**

\* Battery Q7BAT is not available in EU countries.

### 5.2.2 Battery installation

The battery of the Q00JCPU, Q00CPU and Q01CPU is behind the upper front cover of the CPU module. At all other PLC CPU models of MELSEC System Q mounting of the battery is done from the bottom side.

When shipping, the battery connector is disconnected, to prevent discharge or short circuit of the battery during transport and storage.

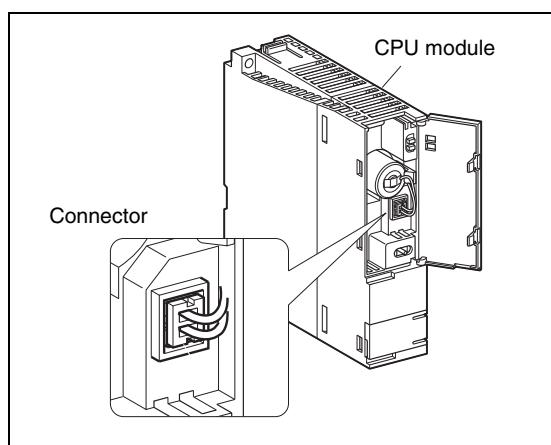

Connect the battery before start up.

#### Q6BAT battery installation procedure

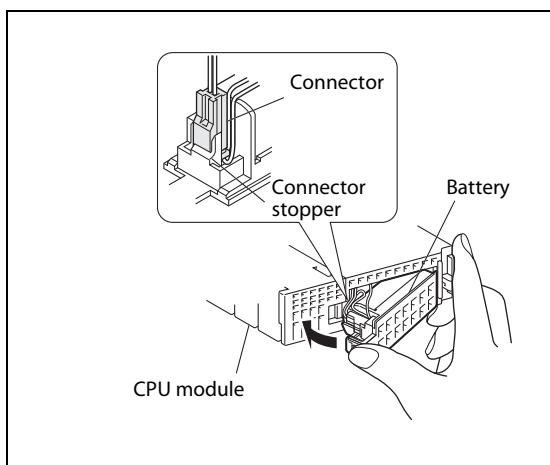

Open the CPU module front cover (for basic model QCUP) or the module bottom cover (for other modules) and confirm that the battery is loaded correctly.

Insert the battery connector into the connector pin on the case. Be sure that the insertion direction is correct.

At those modules where the battery is mounted from the bottom side, check if the connector is properly inserted into the respective holder inside the battery case.

**Fig. 5-10:**  
Location of battery for Basic model QCUP

**Fig. 5-11:**

Location of the battery at the bottom side of the module

### Q7BAT-SET battery installation procedure

#### NOTE

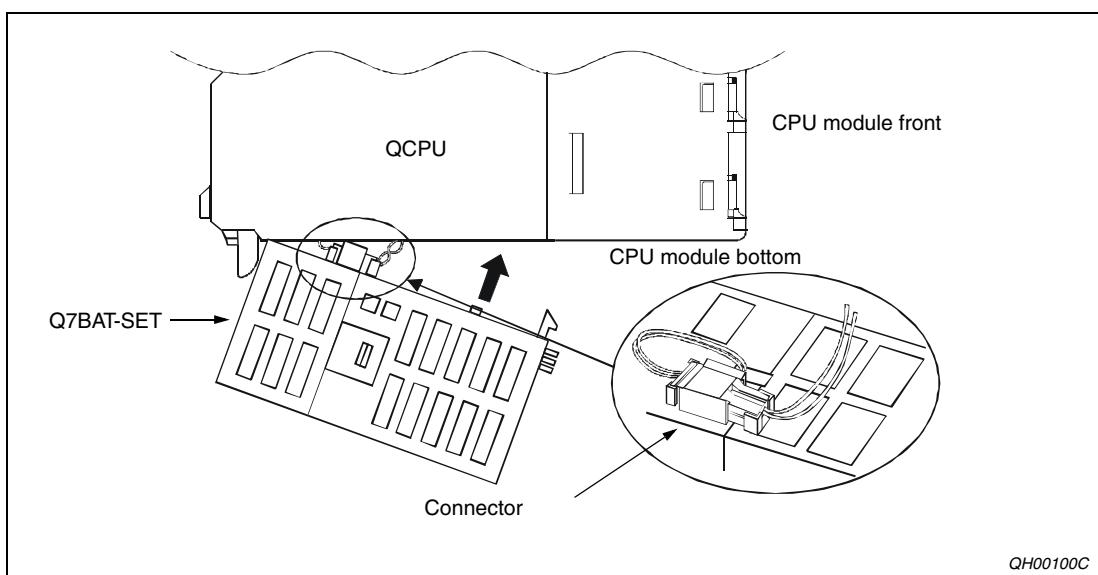

Battery Q7BAT is not available in EU countries.

The following description of mounting the battery Q7BAT is for operation of the MELSEC PLC in a non EU country and for increasing the battery capacity.

For dimensions of the CPU modules with mounted battery Q7BAT refer to the appendix.

The standard battery can be replaced by the battery Q7BAT with considerable higher capacity, except for basic model CPUs Q00JCPU, Q00CPU and Q01CPU. The Q7BAT is not inserted into the battery holder of the CPU module, but mounted with a separate housing under the CPU module.

- ① Open the CPU module bottom cover.
- ② Disconnect the connector connecting the Q6BAT to the CPU module.
- ③ Remove the Q6BAT and cover from the CPU module.
- ④ Connect the Q7BAT-SET (Battery Q7BAT and battery holder) to the battery connector of the CPU module and set it into the connector holder of the battery holder.
- ⑤ Mount the battery holder to the CPU module. The same notches are for fixing as for the cover of the battery case.

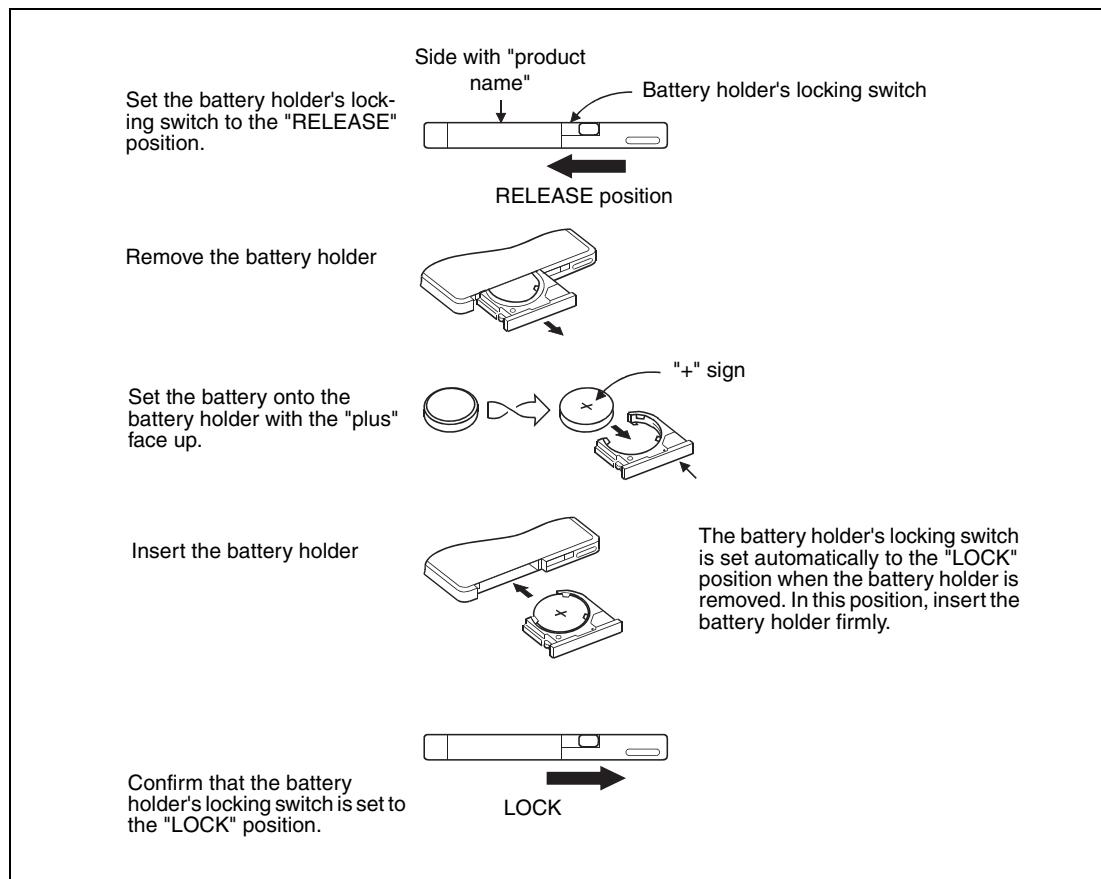

**Fig. 5-12:** Q7BAT-SET battery installation procedure

### 5.2.3 Battery installation into the memory card

The battery is not mounted into the battery holder to prevent discharge or short circuit during transport and storage.

Insert the buffer battery into the memory card before start up.

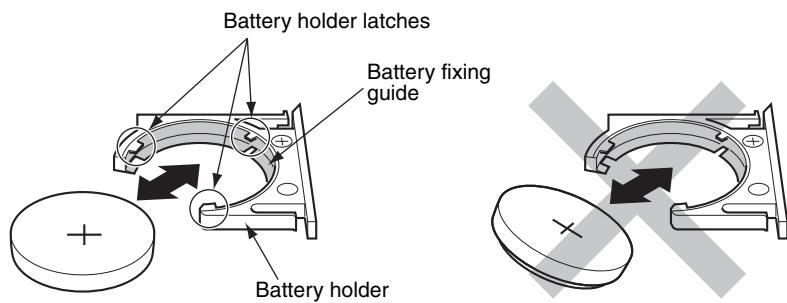

#### Battery installation into the SRAM cards Q2MEM-1MBS and Q2MEM-2MBS

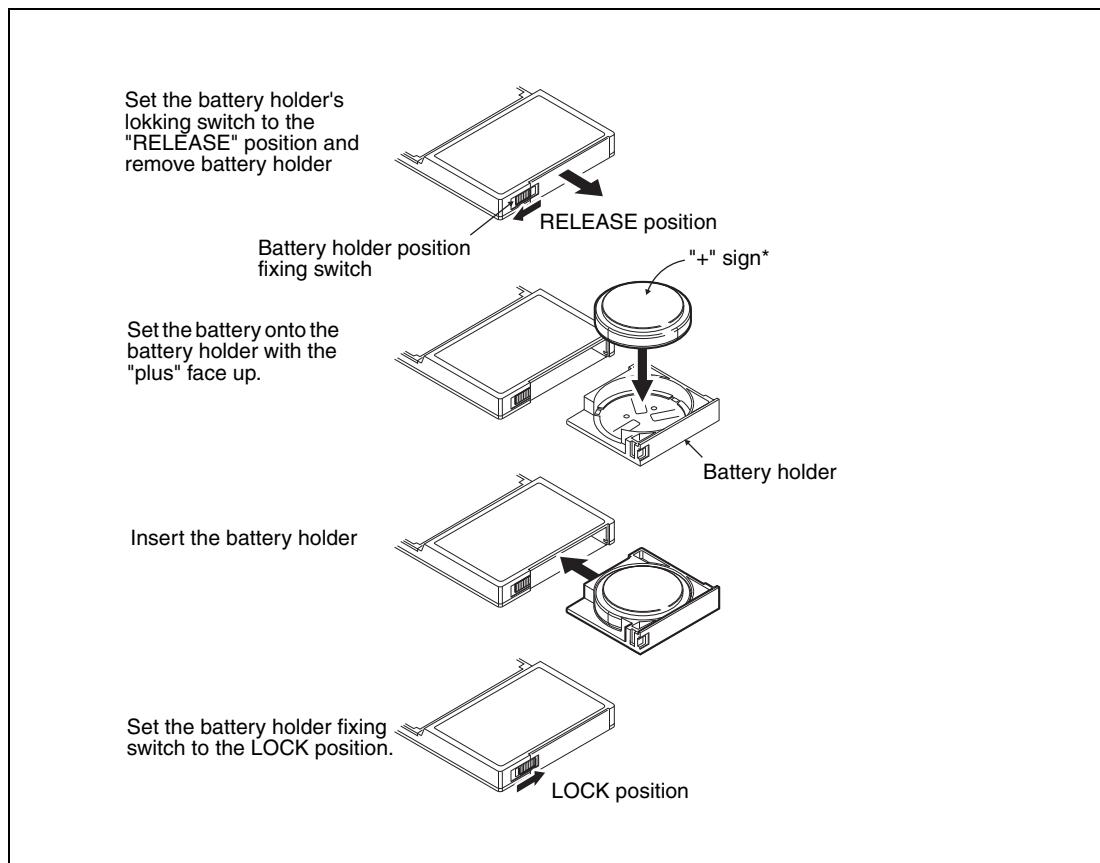

**Fig. 5-13: Battery installation into memory cards Q2MEM-□□□**

#### NOTE

Insert or remove the battery in the horizontal direction along the battery holder fixing guide. Failure to do so may damage the latches of the battery holder.

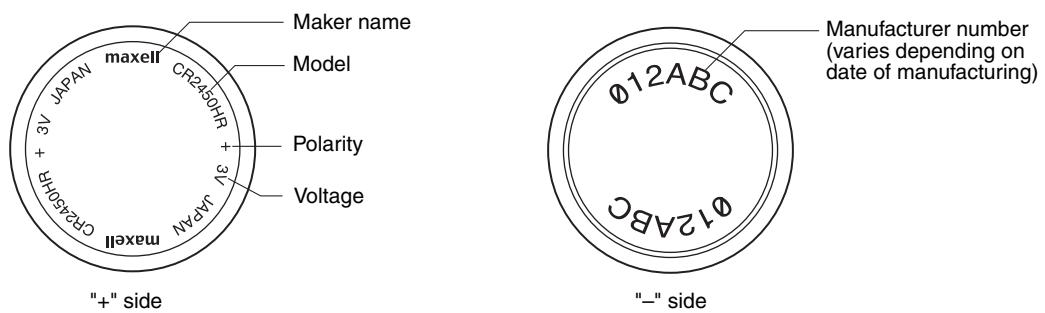

### Battery installation into the SRAM cards Q3MEM-4MBS and Q3MEM-8MBS

**Fig. 5-14: Battery installation into memory cards Q3MEM-□□□**

\* The following figure shows the direction of a battery.

#### 5.2.4

#### Handling instructions

- Do not short circuit
- Do not open the battery
- Do not place in fire
- Do not heat the battery
- Do not solder the battery

# 6 Input and output modules

## 6.1 Selecting I/O modules

### Triac outputs

It is recommended to use triac output modules instead of relay output modules if:

- The outputs should be switched in fast sequence on and off
- A load with high inductance or low power factor should be switched

When using relays for these applications, the life of relay contacts is reduced considerably.

### On and off times when switching inductive loads

The on and off time for switching an inductive loads must be minimum 1 s.

### Inrush current

When controlling external counters or time switches with DC/DC converters, problems can occur at the output module by periodical current peaks, when only the mean value of the current was taken into consideration for selecting the module.

A resistor or an inductance in series to the load can reduce current peaks. Alternatively select an output module for switching higher load currents.

### Input response time

The response time of input modules can be set by parameters. Increase the response time for example to disable short noise pulses, which be recognised with short response time as a set input.

On the other hand "real" input pulses may not be recognised, if the response time is set too long. The following table shows the response time and the corresponding minimum recognisable pulse width.

| Response time setting [ms] | Minimum value of pulse width that may be imported [ms] |
|----------------------------|--|
| 1                          | 0.3  |
| 5                          | 3  |
| 10                         | 6  |
| 20                         | 12   |
| 70                         | 45   |

*Tab. 6-1: Recognisable pulses*

### Overload protective function

Fuses installed in output modules cannot be replaced. They are designed to protect external wiring if the module outputs are shorted.

Therefore, output modules may not be protected from a short circuit.

If an output module becomes faulty due to any cause other than a short circuit, its fuse may not function.

### Overload and overheat protective functions for QY81P

If an overcurrent keeps flowing due to overload, heat is generated to activate the overheat protective function. This protective function is designed to protect the internal elements of the module, not the external equipment.

The overload protective function is activated in 1 point increments in terms of 1 A to 3 A/point. The overload protective function returns operation to normal when the load becomes a rated load.

The overheat protective function is activated in 2 point increments (Y0/Y1, Y2/Y3, etc.) and when overheat protection is activated, that of 2 points is activated simultaneously. By high temperature of one output circuit the overload protection of other outputs may be activated.

If an output turns ON at the activation of the overheat protective function, the actual output voltage oscillates between 0 V and load voltage.

At the load voltage of 24 V, the average voltage during oscillation is approx. 7 V.

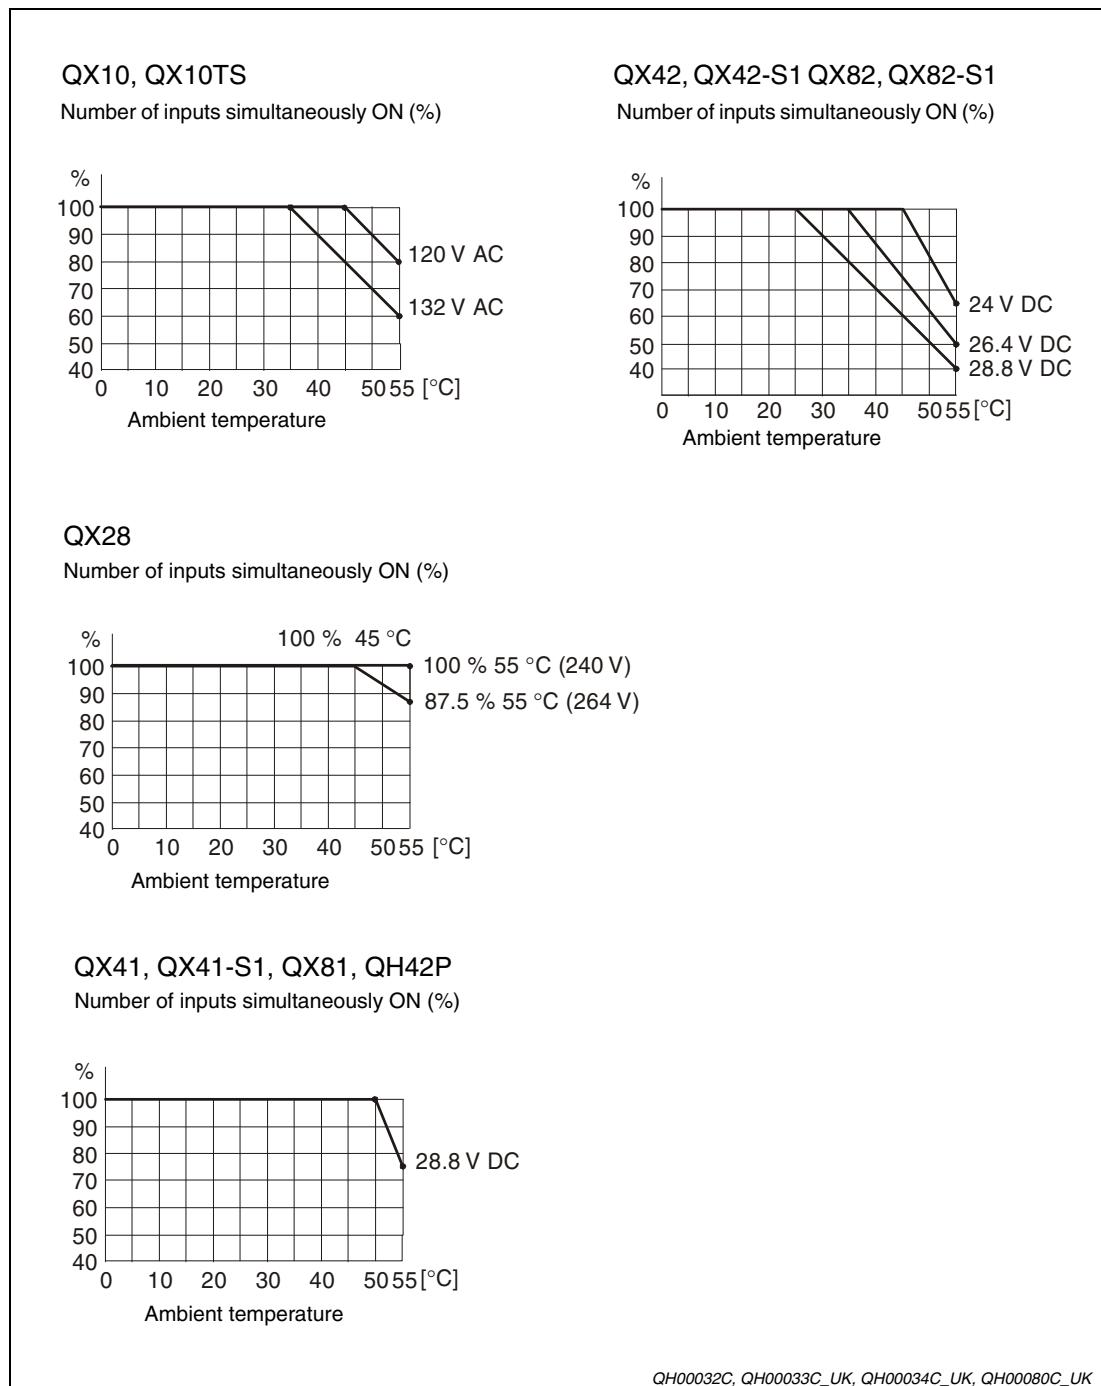

If the output is switched off by the overload protective function, no voltage is output.

To ensure that the output is turned OFF at the activation of the overheat protective function, use an external load which switches OFF at 7 V or more.

The overheat protective function automatically returns operation to normal when heat reduces.

### Number of simultaneously set inputs

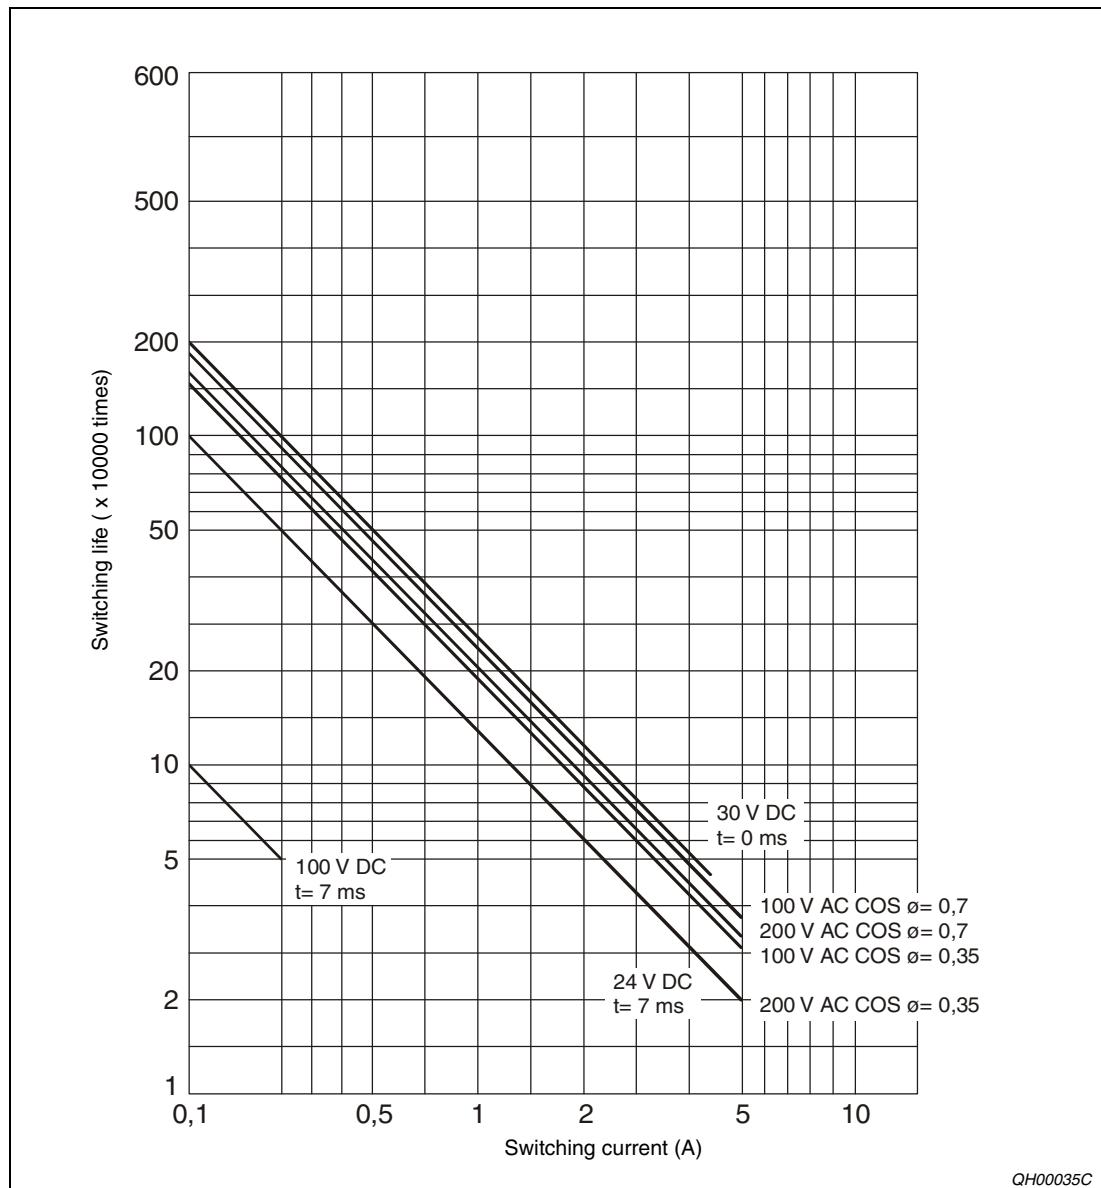

The number of signals, which can be turned ON simultaneously in an input module, varies according to the input voltage and ambient temperature. The number of inputs, which can be turned ON simultaneously is shown in the following diagrams.

**Fig. 6-1:** Maximum number of inputs simultaneously ON

### Service value of relay life

The following chart shows the actual service value of relay life for a relay output module QY10 or QY10-TS.

**Fig. 6-2:** Service value of relay life depending on switching current

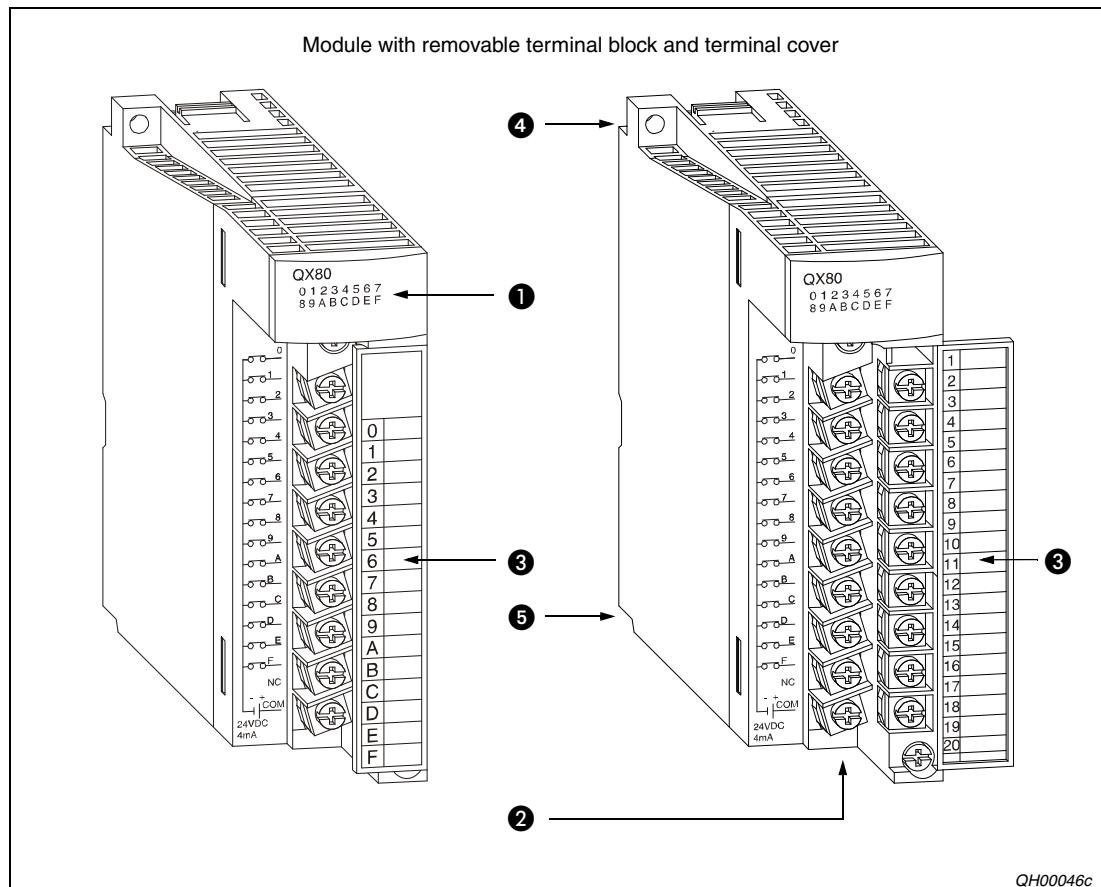

### Screws tightening torque range

| Screw location                                | Tightening torque range |
|---|-------------------------|
| Module fixing screw (M3x12)                   | 36 to 48 Ncm            |
| I/O module terminal block screw (M3)          | 42 to 58 Ncm            |
| I/O module terminal block mounting screw (M3) | 66 to 89 Ncm            |

**Tab. 6-2:** Screws tightening torque range

## 6.2 Part names

### Part names of I/O modules with terminal block

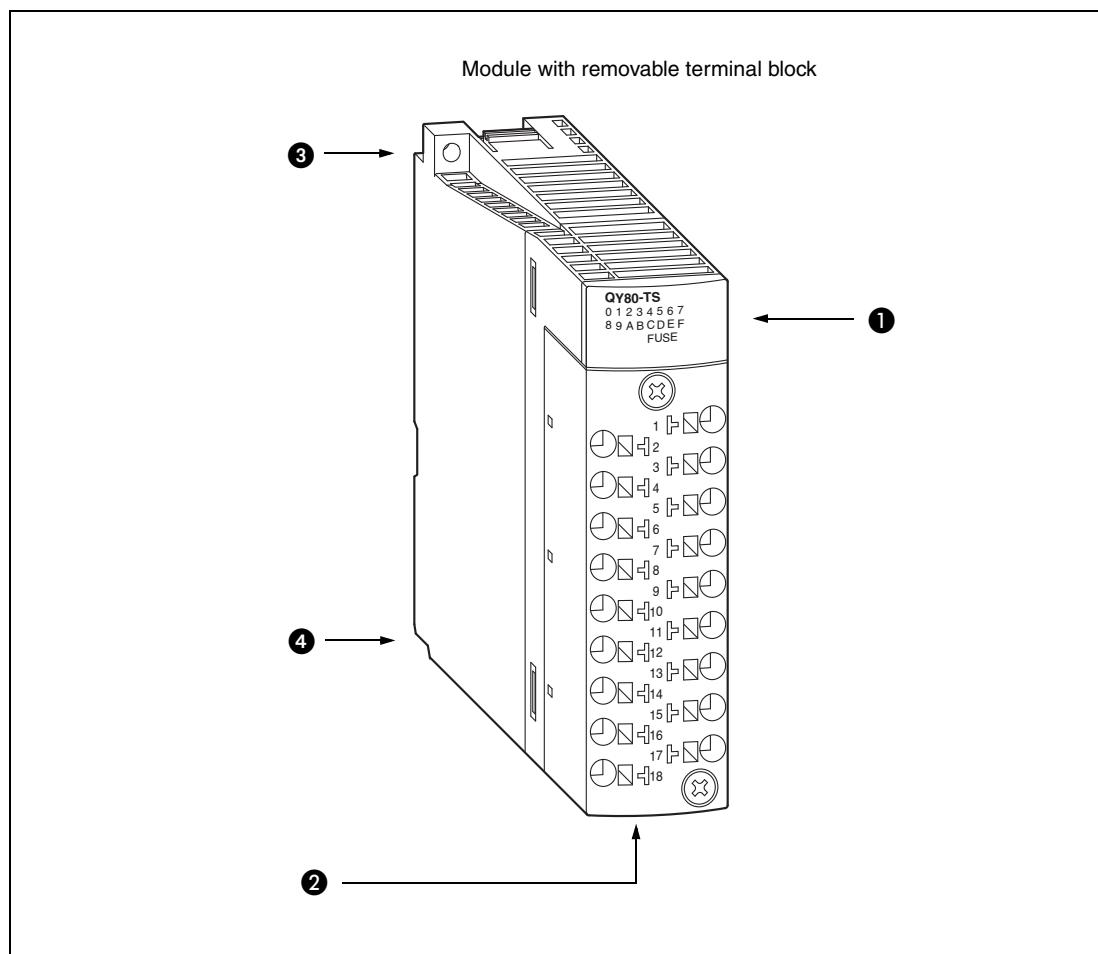

**Fig. 6-3:** Part names of I/O modules with terminal block

| No. | Name                     | Description  |
|-----|--------------------------|--|
| ①   | I/O indicator LED        | Indicates the ON/OFF status of I/O and lit when I/O is ON. |
| ②   | Terminal block           | Used to connect power and I/O signal wires.                |
| ③   | Terminal cover           | The cover protects the terminals against touching.         |
| ④   | Module fixing screw hole | Used to fix the module to the base unit (M3x12 screw)      |
| ⑤   | Module loading lever     | Used to load the module into the base unit.                |

**Tab. 6-3:** Part names description

### Part names of I/O modules with spring terminals

|-----|--------------------------|--|
| ①   | I/O indicator LED        | Indicates the ON/OFF status of I/O and lit when I/O is ON.                 |
| ②   | Terminal block           | Spring clamp terminal block for input and output signals and power supply. |
| ③   | Module fixing screw hole | Used to fix the module to the base unit (M3x12 screw)                      |
| ④   | Module loading lever     | Used to load the module into the base unit.                                |

**Tab. 6-4:** Part names description

### Part names of modules with connector

**Fig. 6-5:** Part names of modules with connector

| No. | Name  | Description   |
|-----|---|---|
| ①   | I/O indicator LED                                     | Indicates the ON/OFF status of I/O and lit when I/O is ON.  |
| ②   | 37-pin D-sub connector<br>40-pin connector            | Designed for 32- or 64-point module and used to connect power and I/O signal wires.                                 |
| ③   | Indication selector switch<br>(64-point modules only) | Used to switch the LED indications between the first-half 32 points and latter-half 32 points of a 64-point module. |
| ④   | Module fixing screw hole                              | Used to fix the module to the base unit (M3x12 screw)   |
| ⑤   | Module loading lever                                  | Used to load the module into the base unit.   |

**Tab. 6-5:** Part names description

# 7 Power supply modules

## 7.1 Overview

Observe the input voltage, output current and the power consumption of the mounted modules when selecting the power supply.

For information about power consumption of the different modules refer to chapter 3 and chapter 12.

### Redundant power supply

To continue the operation of a PLC system or remote I/O station, when a power supply failure occurs, two of each power supply Q63RP or Q64RP can be mounted on a base unit Q38RB, Q68RB or Q65WRB.

During normal operation (no power supply failure) the base unit is supplied by both power supplies. If a failure of one power supply occurs, the other power supply takes over the total supply of the base unit. The LED of the failed power supply changes its colour from green to red. Replacement of the module is possible, during system operation.

In case of a failure the total supply is done by one power supply. Therefore the current of the base unit and of the mounted modules must not exceed 8.5 A.

### When connecting the uninterruptive power supply (UPS)

In case of connecting the power supplies to an UPS (uninterruptable power supply), the input voltage of the power supplies may go maximum 5 % below the rated voltage.

### Notes on handling

#### CAUTION:

- *Note the different input voltages of the power supplies.*
- *Do not drop the devices or subject them to heavy impact.*
- *Do not remove the printed-circuit board of the device from its case.*
- *When drilling screw holes or wiring, cutting chips or wire chips should not enter ventilation slits.*
- *Tighten the fixing screws using torque within the ranges of the table 7-1.*

| Screw                       | Tightening torque range (Ncm) |
|-----------------------------|-------------------------------|
| Terminal screw (M3.5x7)     | 66 to 89                      |
| Module fixing screw (M3x12) | 36 to 48                      |

**Tab. 7-1: Tightening torque range**

## 7.2 Selecting the power supply module

### 7.2.1 Base unit that can be used in combination with power supply module

Following table describes the base unit that can be used in combination with the power supply module respectively.

| Power supply module   | Base unit                     |                         |       |                 |                     |      |                               |       |
|---|-------------------------------|-------------------------|-------|-----------------|---------------------|------|-------------------------------|-------|
|   | Main base unit                |                         |       |                 | Extension base unit |      |                               |       |
|   | Q33B<br>Q35B<br>Q38B<br>Q312B | Q32SB<br>Q33SB<br>Q35SB | Q38RB | Q38DB<br>Q312DB | Q52B                | Q55B | Q63B<br>Q65B<br>Q68B<br>Q612B | Q68RB |
| Q61P-A1<br>Q61P-A2<br>Q61P<br>Q61P-D<br>Q62P<br>Q63P<br>Q64P<br>Q64PN | ●                             | ○                       | ○     | ●               | ○                   | ●    | ○                             | ○     |
| Q61SP   | ○                             | ●                       | ○     | ○               | ○                   | ○    | ○                             | ○     |
| Q63RP<br>Q64RP  | ○                             | ○                       | ●     | ○               | ○                   | ○    | ●                             | ●*    |

**Tab. 7-2:** Combinations of base units and power supply modules

○: Combination not available

●: Combination available

- \* When mounting the Q64RP to the Q65WRB, use the Q64RP whose serial number (first six digits) is "081103" or later. The vibration condition described in the general specifications may not be met if the the Q64RP whose serial number (first six digits) is "081102" or earlier is mounted.

### 7.2.2 Output currents of the power supplies

The power consumption of the base unit and of the mounted CPU, I/O and intelligent function modules must not exceed maximum current of the power supply. Calculate the overall current consumption before selecting a power supply.

| Main base unit          | Rated output current of power supply module at 5 V DC | Power supply module                  |
|-------------------------|---|--------------------------------------|
| Q33B                    | 3.0 A   | Q61P-A1, Q61P-A2, Q61P, Q61P-D, Q63P |
| Q35B                    | 6.0 A   | Q62P                                 |
| Q38B                    |   |                                      |
| Q312B                   |   |                                      |
| Q38DB<br>Q312DB         | 8.5 A   | Q64P, Q64PN                          |
| Q32SB<br>Q33SB<br>Q35SB | 2.0 A   | Q61SP                                |
| Q38RB                   | 8.5 A   | Q63RP, Q64RP                         |

**Tab. 7-3:** Selecting the power supply modules for main base units

| Extension base unit | Rated output current of power supply module at 5 V DC | Power supply module                  |
|---------------------|---|--------------------------------------|
| Q63B                | 3.0 A   | Q61P-A1, Q61P-A2, Q61P, Q61P-D, Q63P |
| Q65B                | 6.0 A   | Q62P                                 |
| Q68B                |   |                                      |
| Q612B               |   |                                      |
| Q68RB<br>Q65WRB     | 8.5 A   | Q64P, Q64PN                          |
| Q68RB<br>Q65WRB     | 8.5 A   | Q63RP, Q64RP                         |

**Tab. 7-4:** Selecting the power supply modules for extension base units

## 7.2.3 Life detection power supply module Q61P-D

The power supply Q61P-D is equipped with life detection. This function estimates the remanent life time of the power supply and indicates it by a LED and by an isolated contact. Together with the POWER LED, failure diagnostics are also possible.

| LED located on the front of the module |                         | LIFE OUT terminal  | Module status   |
|--|-------------------------|--|---|
| POWER                                  | LIFE                    |  |   |
| OFF                                    | OFF                     | OFF  | <ul style="list-style-type: none"> <li>• AC power is not input</li> <li>• Power failure (including momentary power failure for 20 ms or more)</li> <li>• Power supply module failure</li> </ul> |
| ON (green)                             | ON (green)              | ON   | Normal operation  |
|  | ON (orange)             |  | Normal operation (Remaining life approx. 50 %)*   |
|  | Flicker (orange)        | OFF  | Normal operation (Remaining life approx. 1 year)*<br>Replacement of the module is recommended   |
|  | ON: 5 s<br>OFF: 1 s     |  | Normal operation (Remaining life approx. 6 months)*   |
|  | ON: 0.5 s<br>OFF: 0.5 s |  | Life expired  |
|  | OFF                     | Turns off and on three times at intervals of 1 second and then off | Ambient temperature is out of range (Ambient temperature is exceeding the specification)  |
|  | ON (red)                |  | Function failure (Normal processing is not available due to a failure of the life diagnostics circuit in the module)  |
|  | Flicker (red)           |  | Ambient temperature is out of range (Ambient temperature is exceeding the specification and also the life detection function has stopped.)  |
|  | OFF                     | OFF  | Watchdog timer error in the module  |
| ON (orange)                            |                         |  |   |

**Tab. 7-5:** Indication of remaining life (power supply module Q61P-D)

- \* The remaining life of the module varies depending on the ambient temperature.  
(If the ambient temperature rises by 10 °C, the remaining life of the module will be shortened by half.)

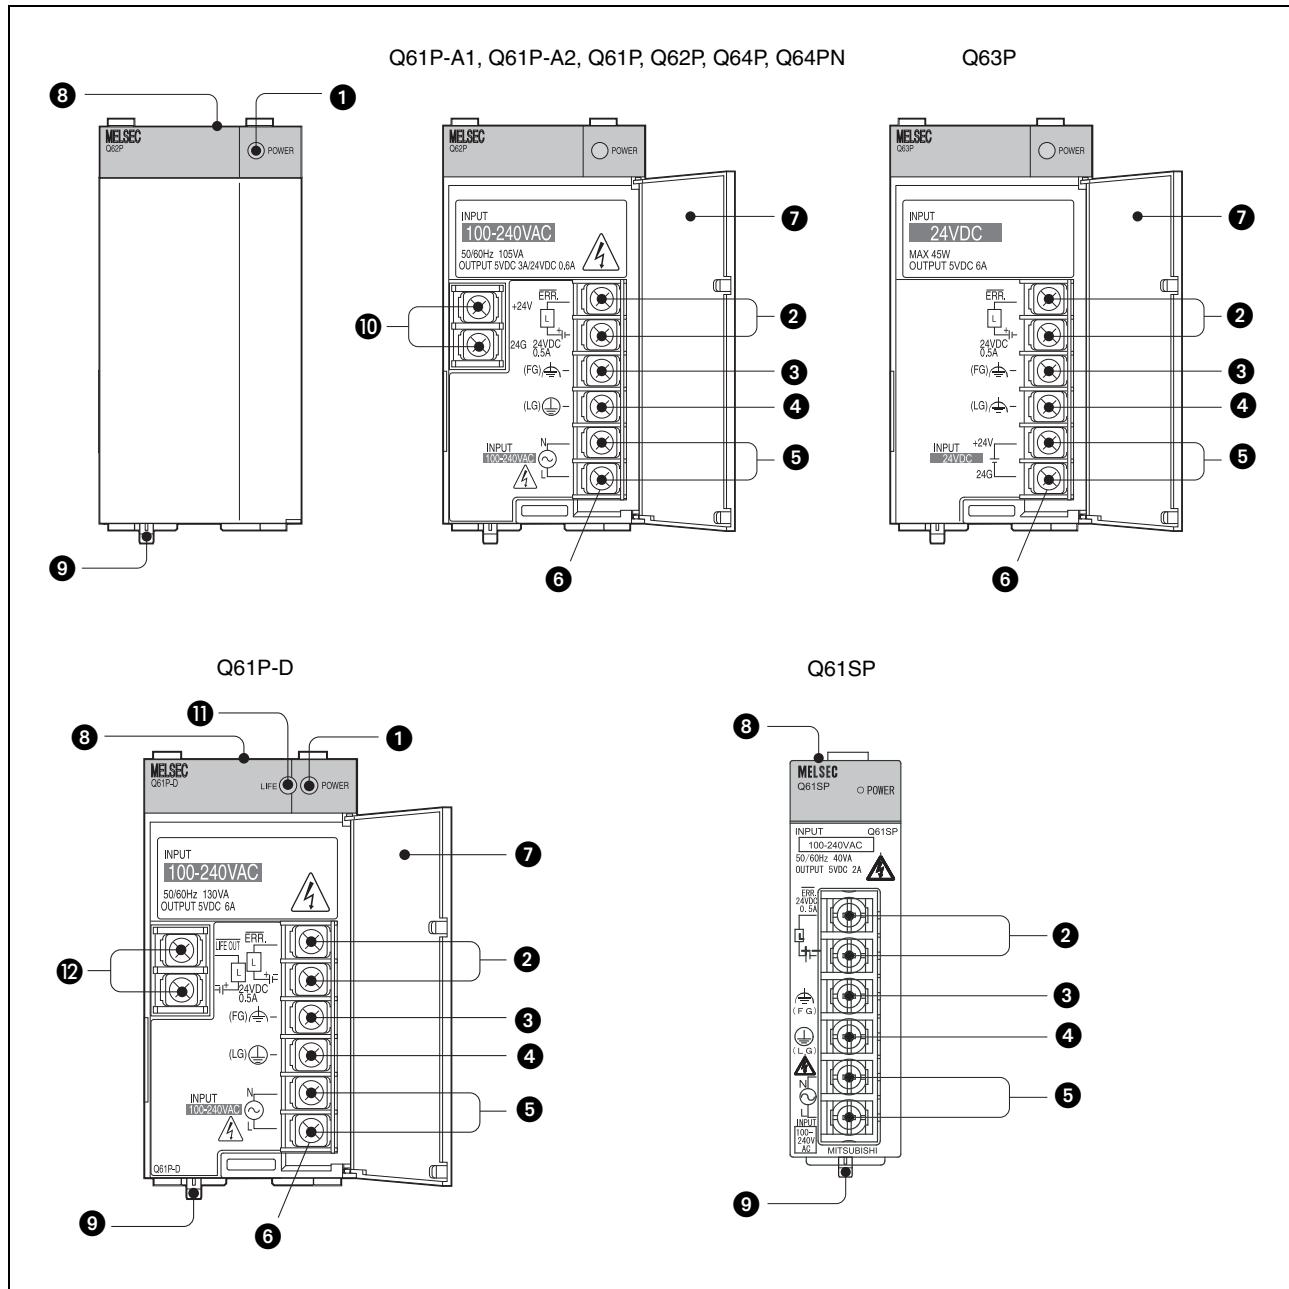

Connect the terminal LIFE OUT to an external lamp or to an PLC input for monitoring by the sequence program to recognise a shorted lifetime.

## 7.3 Part names

Main differences between the power supplies are their input voltages. The output voltage of 5 V is directly input to the base unit and not accessible by terminals.

Besides the 5 V output, the Q62P has an additional output with 24 V/0.6 A.

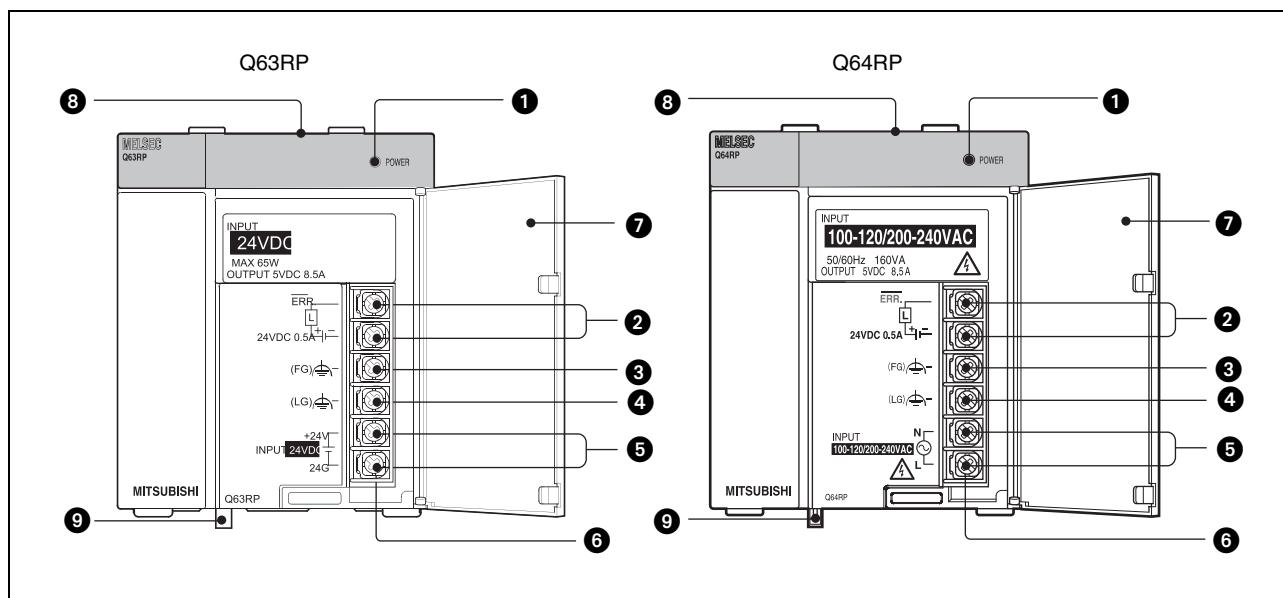

**Q61P-A1, Q61P-A2, Q61P, Q61P-D, Q61SP, Q62P, Q63P, Q64P, Q64PN**

**Tab. 7-7:** Description for part names of power supply modules

## 7.4 Wiring of power supply modules

The following figure shows the schematic wiring of the different power supply types.

**Fig. 7-3:** Wiring of power supply modules

**NOTES**

- Ground the LG and FG terminals to the protective ground conductor.
- Check the rated voltage and terminal layout of the power supply carefully, before wiring.
- When one of the redundant power supplies Q63RP or Q64RP fails or when the input voltage of one power supply shuts off, the other one takes over the whole power supply. Specify your redundant system, that the capacity of one power supply is sufficient for the power consumption of all modules.  
When using two power supplies per base unit, the input voltage should be separated with separate fuses, contactors etc. For replacement of one power supply due to failure or maintenance, each power supply should be switched off separately.
- The internal fuse of the power supplies can't be replaced by the user. Please contact your local Mitsubishi service center or representative for replacing.
- Use the output contact ERR to indicate a failure. Only wire this output when needed. The maximum cable length must not exceed 30 m.  
The output contact ERR has no function (always off) when the power supply is mounted on an extension base unit.
- Do not input a voltage of 200 to 240 V AC into the Q61P-A1 or a voltage of 100 to 120 V AC into the Q61P-A2.
- The Q64P and Q64RP automatically recognize the rated input voltage waveform to switch the input voltage between 100 to 120 V AC and 200 to 240 V AC. Input voltages from 85 to 132 V AC and 170 to 264 V AC are possible.  
Q64P and Q64RP are not compatible with the intermediate voltage (133 to 169 V AC).
- The maximum cable length for the LIFE OUT contact must not exceed 30 m.

# 8 Base units

## 8.1 Overview

The MELSEC System Q offers a wide variety of main and extension base units. Up to four CPU modules, one power supply, input/output modules and intelligent function modules can be mounted on the main base units Q33B-E, Q35B-E, Q38B-E and Q312B-E. Two redundant power supplies Q63RP or Q64RP can be mounted on the main base unit Q38RB-E, so that system performance is increased. This main base unit has additionally 8 slots for up to four CPU modules and I/O or intelligent function modules.

The compact dimensions of the main base units Q32SB, Q33SB and Q35SB allow to build space saving PLC systems.\*

The extension base units Q52B and Q55B have no power supply slot and are supplied by the power supply of the main base unit over the extension cable.

Input, output and intelligent function modules can be mounted on the extension base units Q63B, Q65B, Q68B and Q612B. It has its own power supply for the modules. Use the extension base unit Q68RB for two redundant power supplies Q63RP or Q64RP, to continue operation while one power supply fails.

The base units are connected by extension cable.

- \* The main base units Q32SB, Q33SB and Q35SB have no connector for an extension base unit. Therefore the connection of extension base units or GOTs is not possible via the extension bus.

### 8.1.1 Extension base units that can be combined with the main base unit

The following table shows the possible combinations of main and extension base units of MELSEC System Q.

| Main base unit                | Extension base unit |                               |       |          |  |
|-------------------------------|---------------------|-------------------------------|-------|----------|--|
|                               | Q52B<br>Q55B        | Q63B<br>Q65B<br>Q68B<br>Q612B | Q68RB | Q65WRB ② |  |
| Q00JCPU ①<br>Q00UJCPU ①       | ●                   | ●                             | ○     | ○        |  |
| Q33B<br>Q35B<br>Q38B<br>Q312B | ●                   | ●                             | ○     | ●        |  |
| Q32SB<br>Q33SB<br>Q35SB       | ○                   | ○                             | ○     | ○        |  |
| Q38RB                         | ●                   | ○                             | ●     | ●        |  |
| Q38DB<br>Q312DB               | ●                   | ●                             | ○     | ○        |  |

**Tab. 8-1:** Combination of base units

○: Combination not available

●: Combination available

① Combination of base unit, power supply module and CPU

② Applicable only in a redundant system.

### 8.1.2 Precautions on using the base units Q52B and Q55B

When extension base unit Q52B or Q55B is used, a power of 5 V DC is supplied from the power supply module on the main base unit through an extension cable.

Observe the following points, when specifying a PLC system with the base units Q52B and Q55B:

- The power consumption of the modules mounted on the main base unit and on the base units Q52B and Q55B must not exceed the output current of the main base unit power supply.
- When using the Q52B or Q55B, make sure that the "IN" connector of the Q52B or Q55B is supplied with 4.75 V DC or higher.
- The Q5□B can be used if the voltage drop caused by extension cable is 0.15 V DC or lower. You can calculate the voltage drop occurring at extension cables by multiplying the extension cable conductor resistance (refer to section 8.2) with the power consumption of the extension base unit. Load large current consumption modules on the main base unit.
- For connection of extension base unit Q52B and QQ55B the use of cable Q05B is strongly recommended.

## 8.2 Extension cable

The extension cables are connected to transfer signals between a main base unit and an extension base unit or between extension base units.

| Item                       |          | QC05B | QC06B | QC12B | QC30B | QC50B | QC100B |
|----------------------------|----------|-------|-------|-------|-------|-------|--------|
| Cable length               | m        | 0.45  | 0.6   | 1.2   | 3.0   | 5.0   | 10.0   |
| Conductor resistance value | $\Omega$ | 0.044 | 0.051 | 0.082 | 0.172 | 0.273 | 0.530  |
| Weight                     | kg       | 0.15  | 0.16  | 0.22  | 0.40  | 0.60  | 1.11   |

*Tab. 8-2: Extension cable specifications*

**CAUTION:**

***When the extension cables are used in combination, overall distance of the combined cable must be 13.2 m or less.***

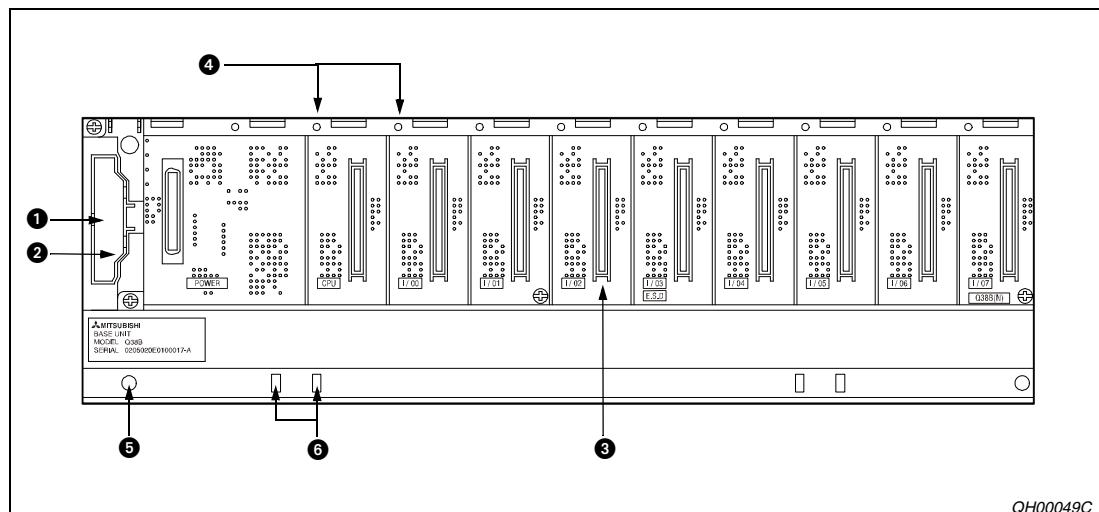

## 8.3 Part names and settings

**CAUTION:**

- ***Do not drop the parts or subject them to heavy impact.***
- ***Do not remove the printed-circuit board of the parts from their cases.***
- ***When drilling screw holes or wiring, cutting chips or wire chips should not enter ventilation slits.***

### 8.3.1 Part names

Main base units Q33B-E, Q35B-E, Q38B-E, Q38RB-E, Q312B-E, Q38DB, Q312DB

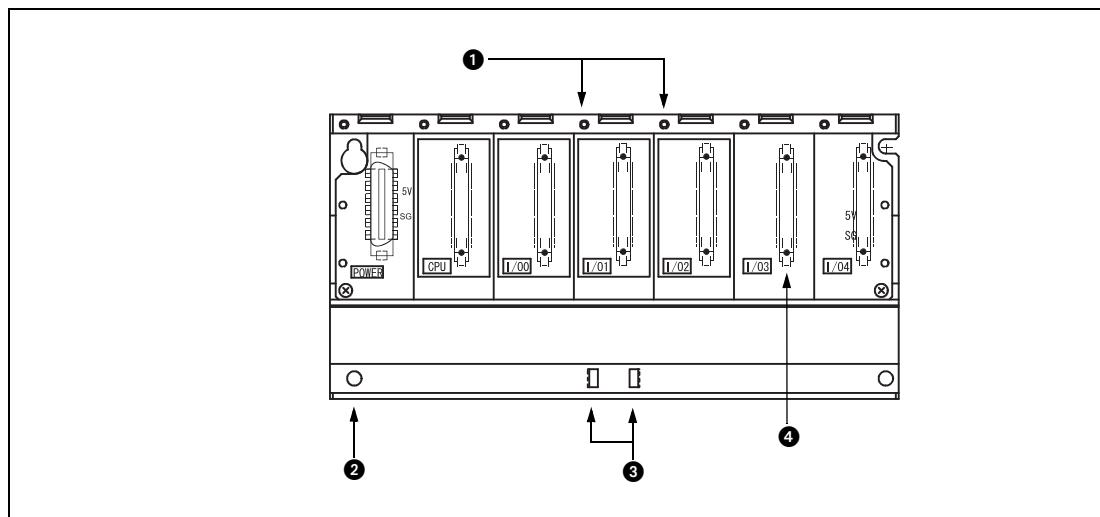

QH00049C

**Fig. 8-1:** Part names of main base units Q3□B, Q3□RB and Q3□DB

| No. | Name                           | Application   |
|-----|--------------------------------|---|
| ①   | Extension cable connector      | Connector for connecting an extension cable (for signal communications with the extension base unit).   |
| ②   | Base cover                     | Do not remove the whole cover. Before an extension cable is connected, the area of the base cover surrounded by the groove under the word "OUT" on the base cover must be removed with a tool such as nippers.  |
| ③   | Module connector               | Connectors for installing the Q series power supply module (two redundant power supply modules for the Q38RB-E), up to four CPU modules, I/O modules, and intelligent function modules.<br>To the connectors located in the spare space where these modules are not installed, attach the supplied connector cover or the blank cover module (QG60) to prevent entry of dirt. |
| ④   | Module fixing screw hole       | Screw hole for fixing the module to the base unit. Screw size: M3x12  |
| ⑤   | Base mounting hole             | Hole for mounting this base unit onto the panel such as a control panel (for M4 screw)  |
| ⑥   | DIN rail adapter mounting hole | Hole for mounting DIN rail adapter.   |

| <b>⑧</b> | DIN rail adapter mounting hole  | Hole for mounting DIN rail adapter.  |

**Tab. 8-6:** Description for part names of extension base units

### Redundant extension base unit Q65WRB

**Fig. 8-5:** Part names of redundant extension base unit Q65WRB

| No. | Name                                     | Application   |
|-----|--|---|
| ①   | Extension cable connectors (IN1 and IN2) | Connector for connecting an extension cable (for signal communications with the redundant system of the main base unit).  |
| ②   | Extension cable connectors (OUT)         | Connector for connecting an extension cable (OUT) (for signal communications with an extension base unit Q68RB).  |
| ③   | Connectors for power supply modules      | Connectors for installing two redundant power supply modules Q63RP or Q64RP.  |
| ④   | Module fixing screw hole                 | Screw hole for fixing the module to the base unit. Screw size: M3x12  |
| ⑤   | Module connector                         | Connectors for installing the I/O modules, and intelligent function modules. To the connectors located in the spare space where these modules are not installed, attach the supplied connector cover or the blank cover module (QG60) to prevent entry of dirt. |
| ⑥   | Base cover of cable connectors           | Protective cover of extension cable connector.  |
| ⑦   | DIN rail adapter mounting hole           | Hole for mounting DIN rail adapter.   |
| ⑧   | Base mounting hole                       | Hole for mounting this base unit onto the panel such as a control panel (for M4 screw)  |

**Tab. 8-7:** Description for part names of redundant extension base unit Q65WRB

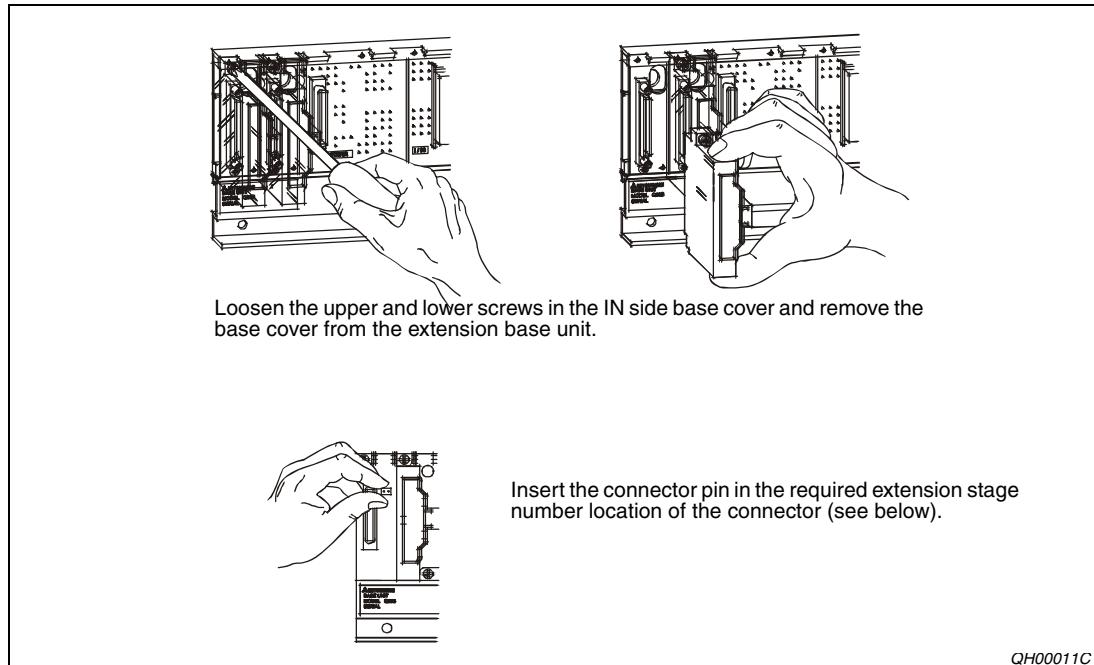

#### NOTE

It's only possible to use the extension base unit Q65WRB in a redundant system as the first extension stage (direct connection to the main base unit). Extension base No. setting (refer to following section 8.3.2) is not possible and not required for the Q65WRB.

### 8.3.2 Setting the extension stage number

When using two or more extension base units, the extension stage number must be set with their extension stage number setting connectors. The extension stage number is set to 1 by factory default. There is no need to set the extension stage number, when only one extension base unit with factory default status is connected to the main base unit.

The extension stage number setting connector of the extension base unit is located under the IN side base cover.

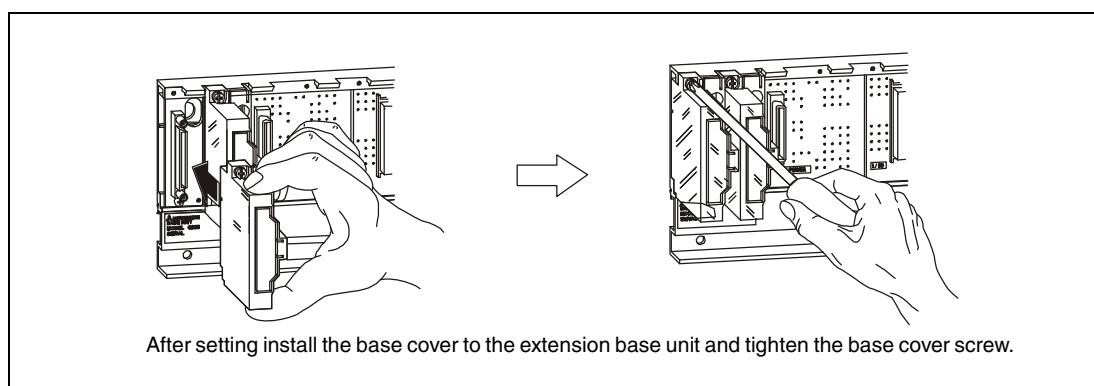

**Fig. 8-6:** Setting the extension stage number

Setting of connector pins for extension bases:

|                           | Number setting for extension stages |   |   |   |   |   |   |
|---------------------------|-------------------------------------|---|---|---|---|---|---|
|                           | 1                                   | 2 | 3 | 4 | 5 | 6 | 7 |
| Setting of connector pins |                                     |   |   |   |   |   |   |

**Tab. 8-8:** Settings of connector pins

**Fig. 8-7:** Base cover removal procedure

**NOTES**

Please note, that the maximum number of extension base units, which can be connected to the main base unit is depending on the CPU type:

|  |                             |
|--|-----------------------------|
| Q00JCPU, Q00UJCPU:                                     | 2                           |
| Q00CPU, Q00UCPU, Q01CPU, Q01UCPU, Q02UCPU:             | 4                           |
| Q02CPU, Q02HCPU, Q06HCPU, Q12HCPU, Q25HCPU:            | 7                           |
| Q02PHCPU, Q06PHCPU, Q12PHCPU, Q25PHCPU:                | 7                           |
| Q03UD(E)CPU, Q04UD(E)HCPU, Q06UD(E)HCPU, Q10UD(E)HCPU, |                             |
| Q13UD(E)HCPU, Q20UD(E)HCPU, Q26UD(E)HCPU:              | 7                           |
| Q12PRH and Q25PRH:                                     | 7 (refer to following note) |

The extension base unit cannot be connected when the serial number (first five digits) of the redundant CPU Q12PRH- or Q25PRHCPU is "09011" or earlier.

For a main base unit with redundant Q12PRHCPU or Q25PRHCPU from serial number 09012... on, the extension is possible with up to seven base units and maximum 63 modules.

Connect the Q65WRB to the first extension base. Since the Q65WRB is fixed to the first extension base, base number setting is not required. Use the Q68RB for the second extension base to the seventh extension base. Set the extension stage number as described above.

If a prohibited extension stage number is set, "BASE LAY ERROR" (error code: 2010) occurs.

**CAUTION:**

- **Never set more than one jumper on the connector pins of the extension base unit.**
- **Set the extension stage number for extension base units in the order of connecting, starting from the one connected to the main base unit. The same jumper setting for more than one extension base unit or a missing jumper causes malfunction.**

### 8.3.3 Connection and disconnection of extension cable

**NOTE**

Always plug the OUT side connector of a base unit and the IN side connector of the next base unit with an extension cable.

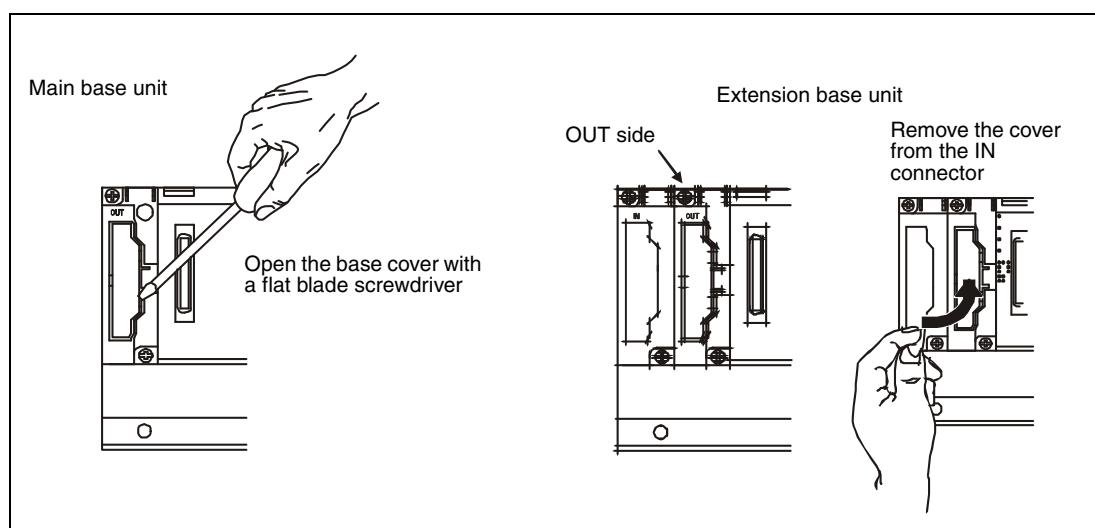

The system will not operate properly if the extension cable is connected in the form of IN to IN, OUT to OUT or IN to OUT.

**Instructions for handling an extension cable:**

- Connect the extension cable to the base unit with the base cover installed to the base unit. After you have set the extension number to the extension base unit, reinstall and screw the base cover.

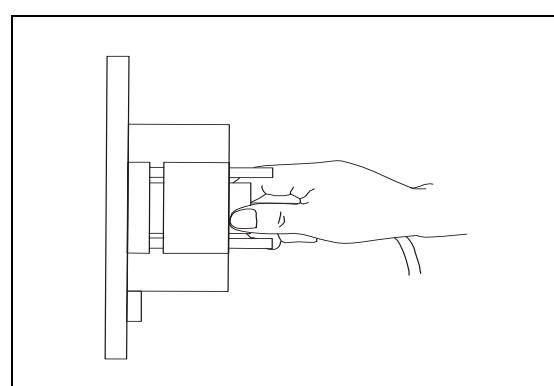

To connect an extension cable to the main base unit, remove the portion under the OUT characters on the base cover. This also applies to a case where an extension cable is connected to the OUT side connector of the extension base unit.

Remove the cover from the IN connector of the extension base unit.

- Do not squeeze the extension cable.
- When connecting or disconnecting an extension cable, do not hold the ferrite cores mounted at both ends of the cable. **Only** hold the connector part of the cable (refer to the following figure). Holding the ferrite core may cause a cable disconnection in the connector.

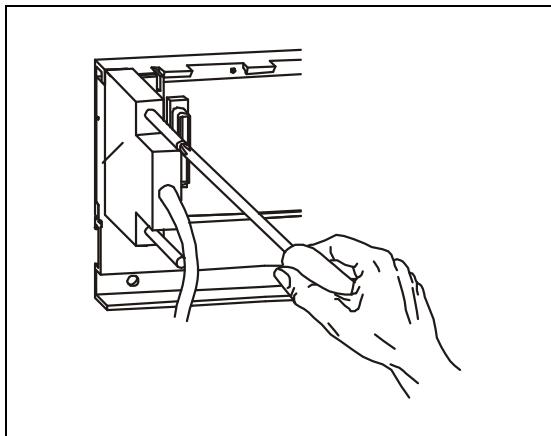

Also, if the ferrite core position is shifted, the characteristic will change. When handling the cable, do not shift the ferrite core position.

**Fig. 8-8:**

Hold the connector part of the extension cable

- When laying an extension cable, secure 55 mm or more as the minimum cable bending radius. If it is less than 55 mm, a malfunction may occur due to characteristic deterioration, cable disconnection or the like.
- After fitting the extension cable, always tighten the extension cable connector fixing screws. (Tightening torque: 0.2 Nm.)

**Fig. 8-9:**

Connection of extension cable connector with screws

#### Disconnection of extension cable

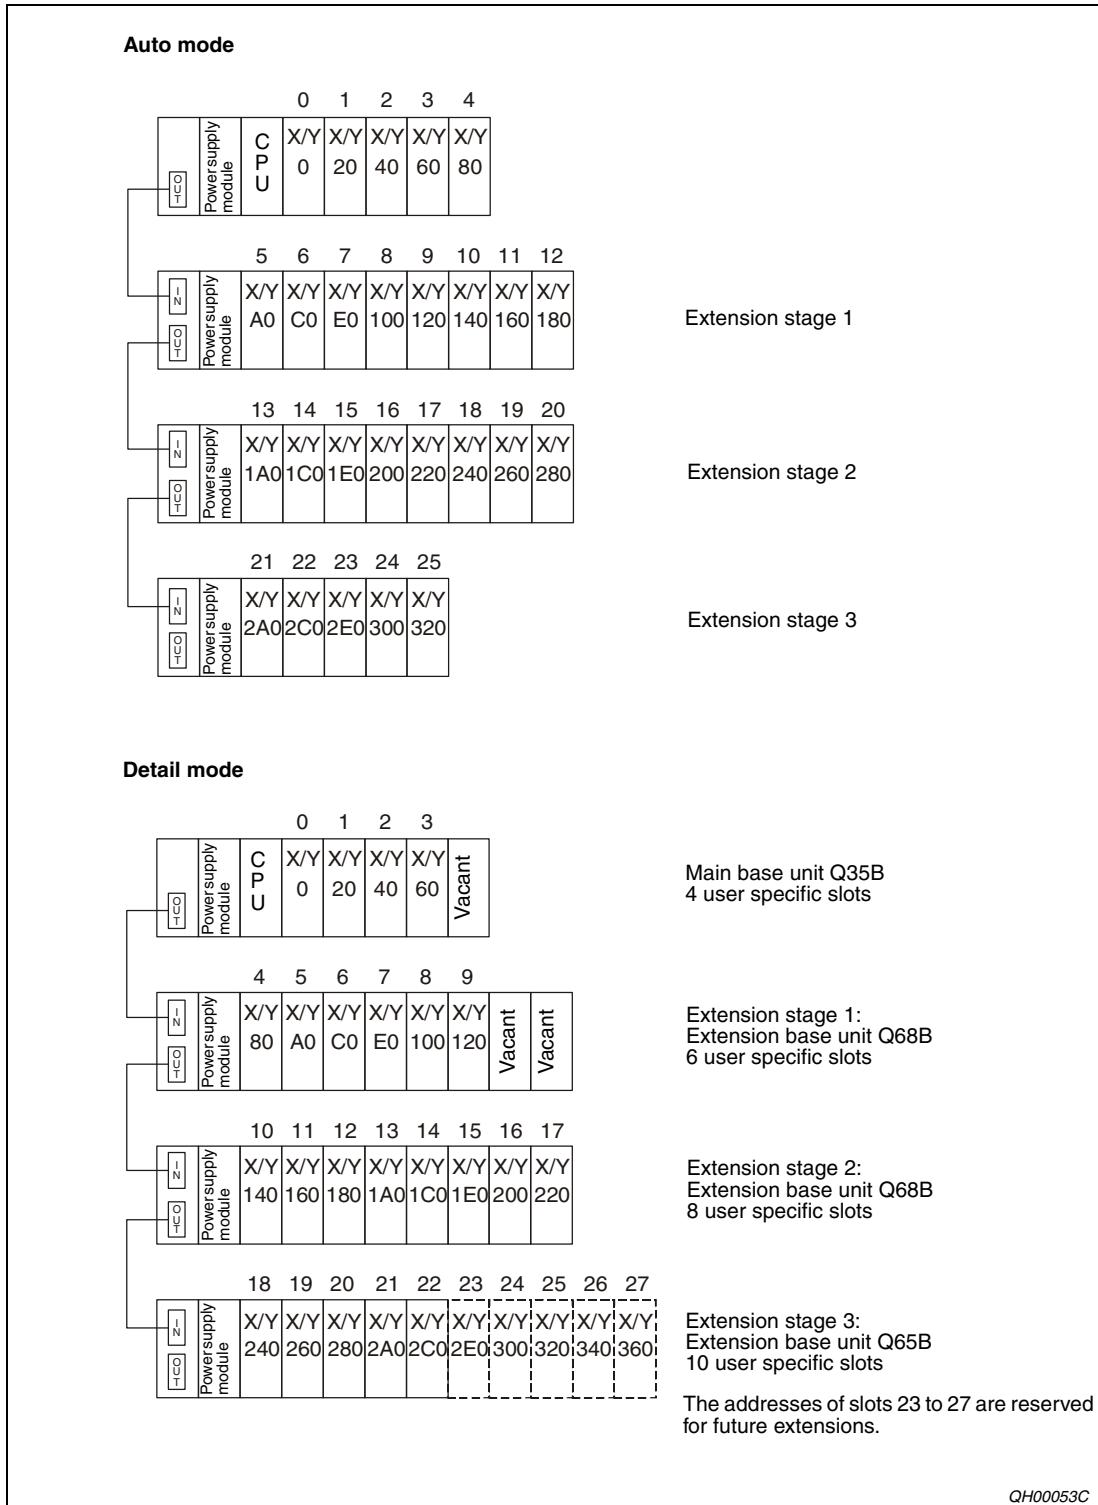

When disconnecting the extension cable, hold and pull the connector part of the extension cable after confirming that the fixing screws have been completely removed.

## 8.4 I/O Number assignment

A CPU of the MELSEC System Q automatically recognises the slots available in main and extension base units and assigns addresses to the inputs and outputs accordingly.

The assignment can also be done by the user. Thus slots can be left empty or addresses can be reserved for future extensions.

The following figure shows examples for I/O assignment:

**Fig. 8-10: I/O number assignment example**

# 9 Installation

## 9.1 Safety guidelines

**DANGER:**

- *Outputs may remain on or off due to a failure of an output module relay or transistor. Configure an external circuit for monitoring output signals that could cause a serious accident.*
- *In an output module, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.*
- *Malfunction may occur if an external power supply or the programmable controller is faulty. To prevent any malfunction which may affect the whole system and in a fail-safe viewpoint, provide an external circuit to the areas which can result in machine breakdown and accidents (e.g. emergency stop, protective and interlock circuits) must be constructed outside the programmable controller.*

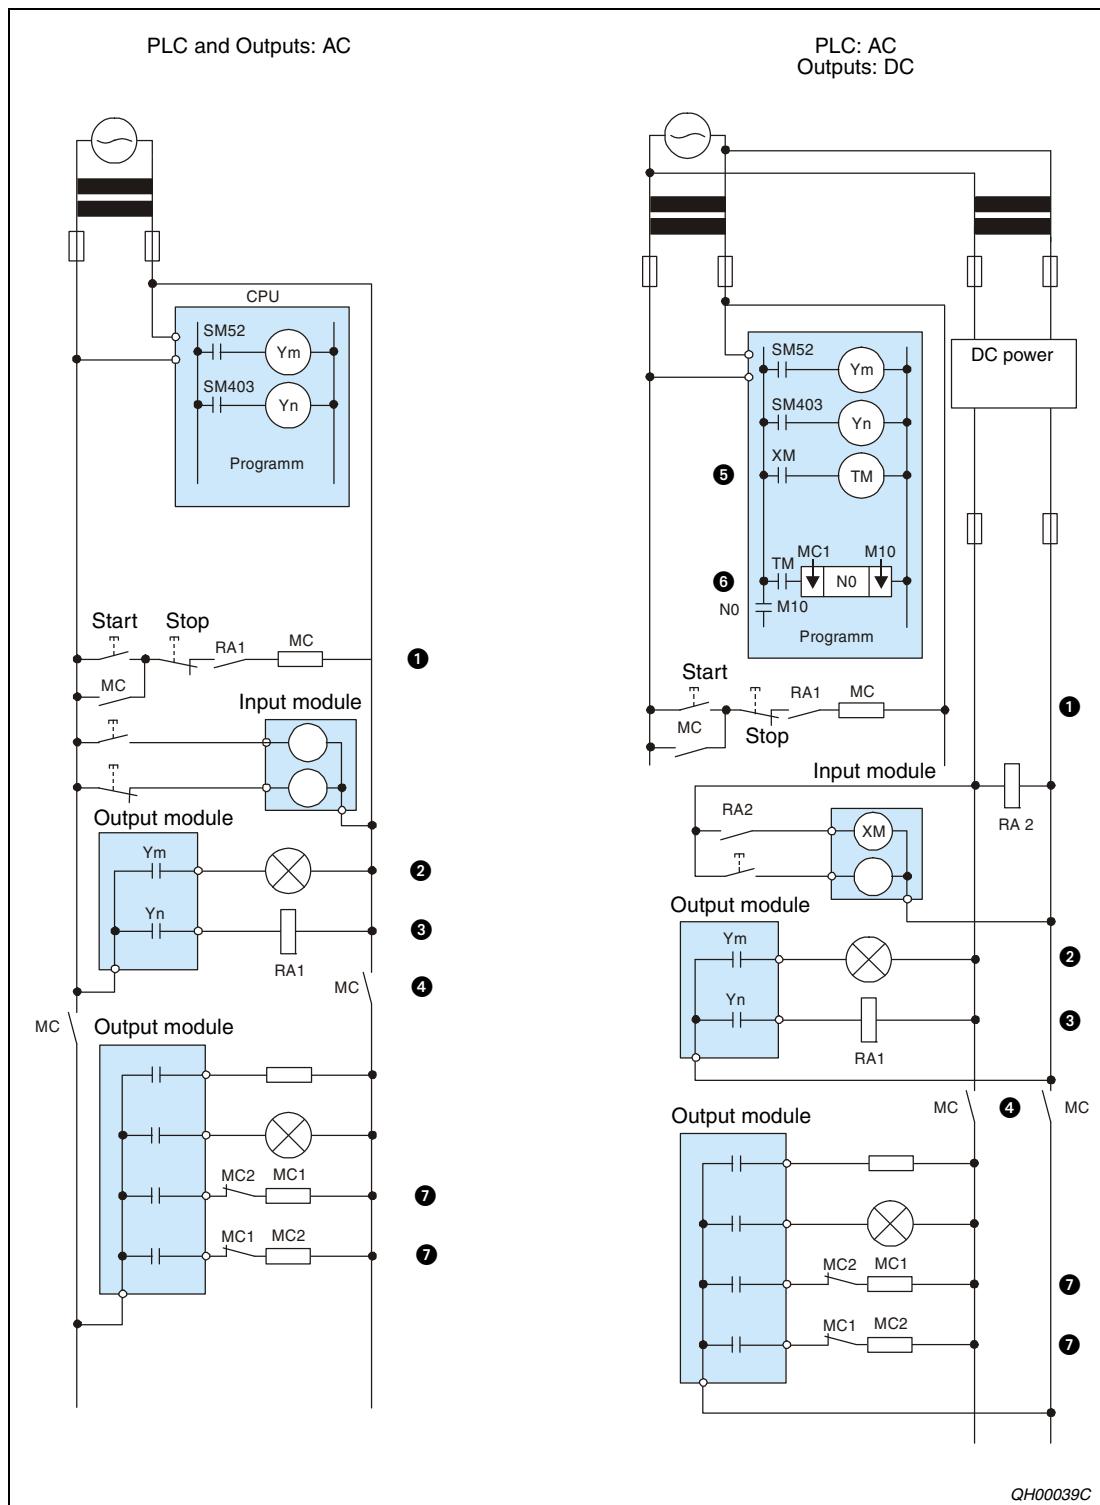

When the programmable controller is powered on and off, normal control output may not be done momentarily due to a delay or a start-up time difference between the programmable controller power supply and the external power supply (DC in particular) for the control target.

For example, if the external power supply for the controlled object is switched on in a DC output module and then the programmable controller power supply is switched on, the DC output module may provide false output instantaneously at power-on of the programmable controller. Therefore, it is necessary to make up a circuit that can switch on the programmable controller power supply first.

Malfunction may occur if an external power supply or the programmable controller is faulty. To prevent any malfunction which may affect the whole system and in a fail-safe viewpoint, provide an external circuit to the areas which can result in machine breakdown and accidents (e.g. emergency stop, protective and interlock circuits) must be constructed outside the programmable controller.

The following page give examples of system designing in the above viewpoint.

System design circuit example (when not using  $\overline{ERR}$ . terminal of power supply module):

**Fig. 9-1: System design circuit example (when not using  $\overline{ERR}$ . terminal)**

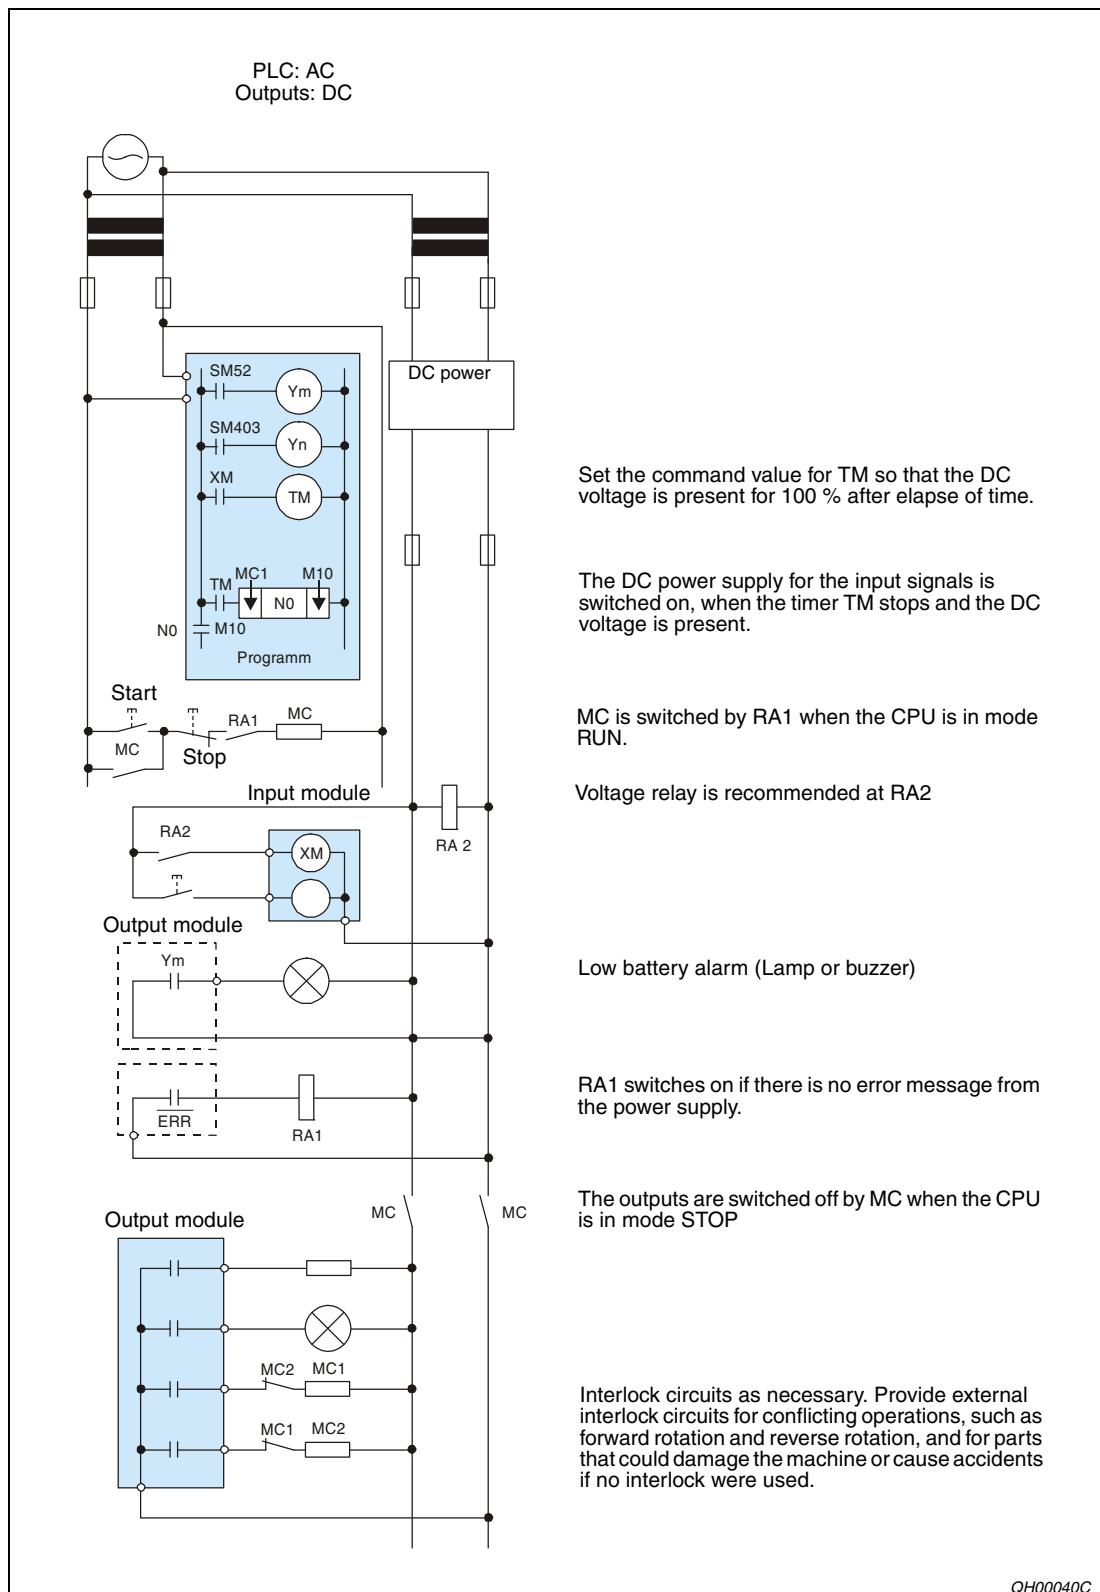

- ① MC is switched by RA1 when the CPU is in mode RUN.
- ② Low battery alarm (Lamp or buzzer).
- ③ RA1 is switched by SM403 when the CPU is in mode RUN.
- ④ The outputs are switched off by MC when the CPU is in mode STOP.
- ⑤ When the DC voltage is switched on, RA2 starts the timer TM via input XM.

- ⑥ The DC power supply for the input signals is switched on, when the timer TM stops and the DC voltage is present.
- ⑦ Interlock circuits as necessary. Provide external interlock circuits for conflicting operations, such as forward rotation and reverse rotation, and for parts that could damage the machine or cause accidents if no interlock were used.

**The power-on procedure is as follows:**

- For AC:
  - Turn power on.
  - Set CPU to RUN.
  - Turn on the start switch.
  - When the magnetic contactor (MC) comes on, the output equipment is powered and may be driven by the program.
- For AC/DC:
  - Turn power on.
  - Set CPU to RUN.
  - When DC power is established, RA2 goes ON.
  - Timer (TM) times out after the DC power reaches 100 %. (The TM set value must be the period of time from when RA2 goes ON to the establishment of 100 % DC voltage. Set this value to approximately 0.5 seconds.) If a voltage relay is used at RA2, no timer (TM) is required in the program.
  - Turn on the start switch.
  - When the magnetic contactor (MC) comes on, the output equipment is powered and may be driven by the program.

System design circuit example (when using  $\overline{ERR}$ . terminal of power supply module):

**Fig. 9-2: System design circuit example (when using  $\overline{ERR}$ . terminal of power supply module)**

**The power-ON procedure is as follows:**

- Turn power on.
- Set CPU to RUN.
- When DC power is established, RA2 goes ON.
- Timer (TM) times out after the DC power reaches 100 %. (The TM set value must be the period of time from when RA2 goes ON to the establishment of 100 % DC voltage. Set this value to approximately 0.5 seconds.) If a voltage relay is used at RA2, no timer (TM) is required in the program.
- Turn on the start switch.
- When the magnetic contactor (MC) comes on, the output equipment is powered and may be driven by the program.

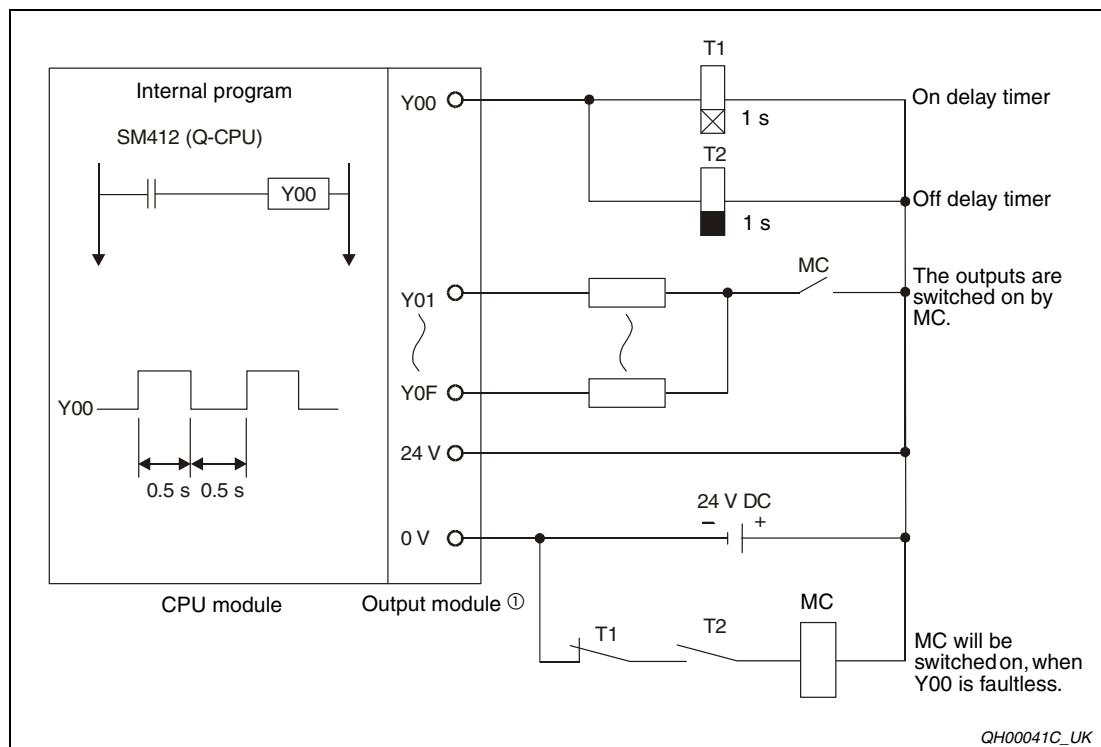

**Fail-safe measures against failure of the programmable controller**

Failure of a CPU module or memory can be detected by the self-diagnosis function. However, failure of I/O control area may not be detected by the CPU module.

In such cases, all I/O points turn on or off depending on a condition of problem, and normal operating conditions and operating safety cannot be maintained.

Though Mitsubishi programmable controllers are manufactured under strict quality control, they may cause failure or abnormal operations due to unspecific reasons.

To prevent the abnormal operation of the whole system, machine breakdown, and accidents, the fail-safe circuitry against failure of the programmable controller can be constructed as shown in the following figure.

**Fig. 9-3: Fail-safe circuit example**

① Y00 will be switched on and off in intervals of 0.5 s by SM412. Therefore use a contactless output module with transistor outputs.

## 9.2 General specifications

Do not use or store the modules of MELSEC System Q in an environment as follows:

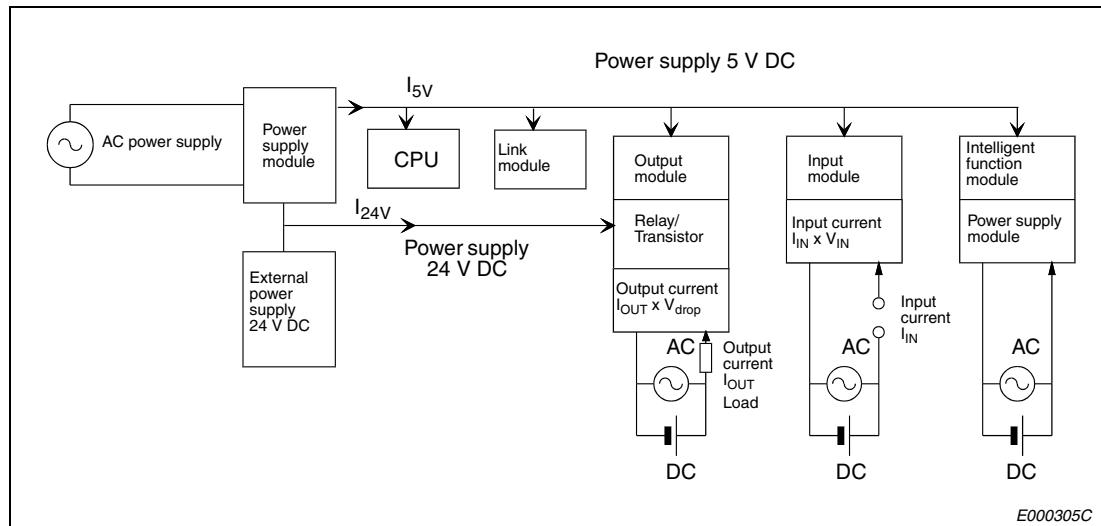

- Operating ambient temperature exceeding 0 to +55 °C
- Storage ambient temperature exceeding –20 bis +75 °C
- Operating ambient humidity exceeding 5 % bis 95 %
- Operating areas with air condensing by sudden temperature changes.
- Areas with flammable gas
- Areas with conductive dust (iron filings, oily smoke, dust, corrosive gas or organic solvent)
- Operating areas with direct solar irradiation
- Operating areas with high magnetic or high voltage fields
- Operating areas with high vibration impact or sound waves affecting the PLC

Keep a distance of minimum 25 cm to the PLC when using mobile phones.

## 9.3 Calculating heat generation of programmable controller

The ambient temperature inside the panel storing the programmable controller must be suppressed to an ambient temperature of 55 °C. The heat generated by the system should be lead off by ventilation devices.

Following figure shows the power consuming parts of the programmable controller:

**Fig. 9-4: Calculation of the power consumption**

### Power consumption of power supply module

The power conversion efficiency of the power supply module is approx. 70 %, while 30 % of the output power is consumed as heat. As a result, 3/7 of the output power is the power consumption.

The calculation formula is as follows:

$$W_{PW} = 3/7 (I_{5V} \times 5 V) [W]$$

$W_{PW}$ : Heat capacity of the power supply

$I_{5V}$ : Current consumption of logic 5 V DC circuit of each module [A]

### Total power consumption for 5 V DC logic circuits of all modules

The power consumption of the 5 V DC output circuit section of the power supply module is the power consumption of each module (including the current consumption of the base unit) multiplied by the 5 V power supply.

$$W_{5V} = I_{5V} \times 5 V [W]$$

### A total of 24 V DC average power consumption of the output modules

The sum of all currents, flowing into the output modules with all outputs switched on, multiplied by the voltage of the external power supply results in the total power consumption at 24 V DC .

$$W_{24V} = I_{24V} \times 24 V \times \text{Simultaneous ON rate} [W]$$

### Average power consumption due to voltage drop in the output section of the output module

$$W_{\text{OUT}} = I_{\text{OUT}} \times V_{\text{drop}} \times n \times O_S [\text{W}]$$

$I_{\text{OUT}}$ : Output current (Current in actual use)

$V_{\text{drop}}$ : Voltage drop in each output module

n: Number of outputs

$O_S$ : Simultaneous ON rate (specifies how many outputs are switched on simultaneously,  
 $O_S = 1$ : all outputs simultaneously ON)

### Average power consumption of the input section of the input module

$$W_{\text{IN}} = I_{\text{IN}} \times V_{\text{IN}} \times n \times I_S [\text{W}]$$

$I_{\text{IN}}$ : Input current (Effective value for AC)

$V_{\text{IN}}$ : Input voltage (Voltage in actual use)

n: Number of input points

$I_S$ : Simultaneous ON rate (specifies how many inputs are switched on simultaneously,  
 $I_S = 1$ : all inputs simultaneously ON)

### Power consumption of the external power supply section of the intelligent function module

The calculation formula for the power consumption of intelligent function modules is as follows:

$$W_S = I_{5V} \times 5 \text{ V} + I_{24V} \times 24 \text{ V} + I_{100V} \times 100 \text{ V} [\text{W}]$$

### Overall power consumption of the programmable controller system

The total of the power consumption values calculated for each block becomes the power consumption of the overall sequencer system:

$$W = W_{\text{PW}} + W_{5V} + W_{24V} + W_{\text{OUT}} + W_{\text{IN}} + W_S [\text{W}]$$

From this overall power consumption (W), calculate the heating value and a rise in ambient temperature inside the panel. The outline of the calculation formula for a rise in ambient temperature inside the panel is shown below.

$$T = W / (U \times A) [{}^{\circ}\text{C}]$$

W: Power consumption of overall sequencer system

A: Surface area inside the panel ( $\text{m}^2$ )

U: 6, when the ambient temperature inside the panel is uniformed by a fan

4, when air inside the panel is not circulated

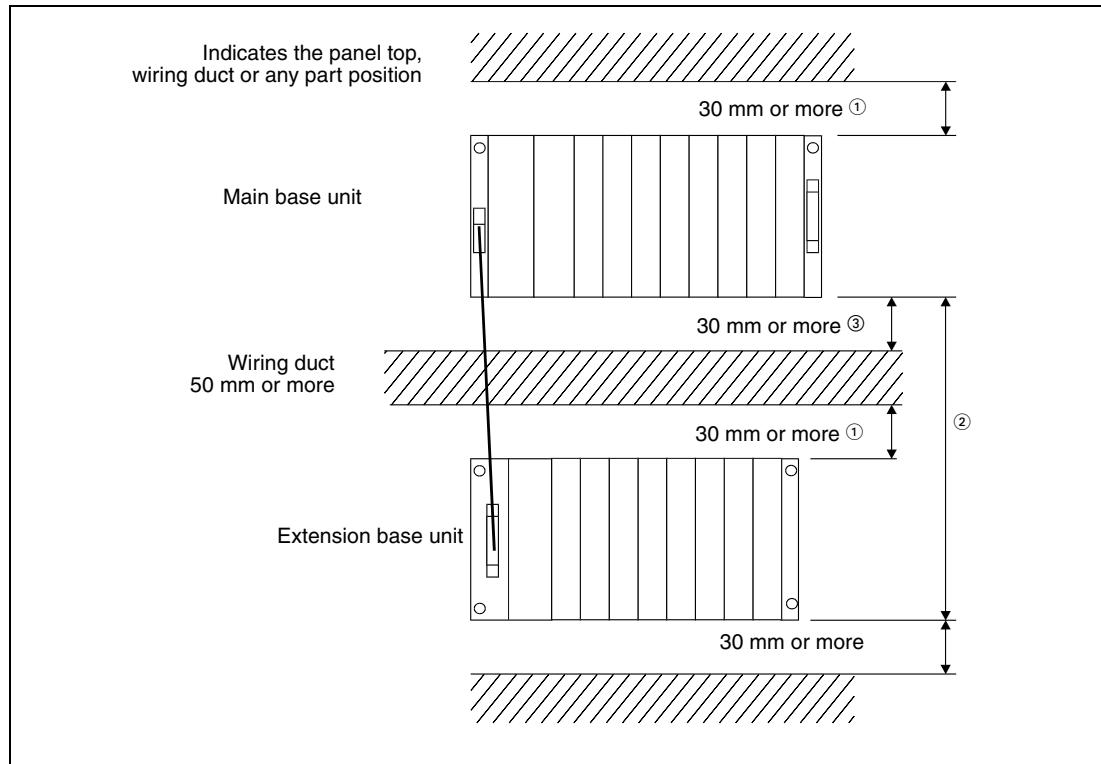

#### NOTES

If the temperature inside the panel has exceeded the specified range ( $55 {}^{\circ}\text{C}$ ), it is recommended to install a fan, a heat exchanger or chiller to the panel to lower the temperature.

Fans should always be equipped with appropriate dust filters and sufficient protection.

## 9.4 Mounting the base unit

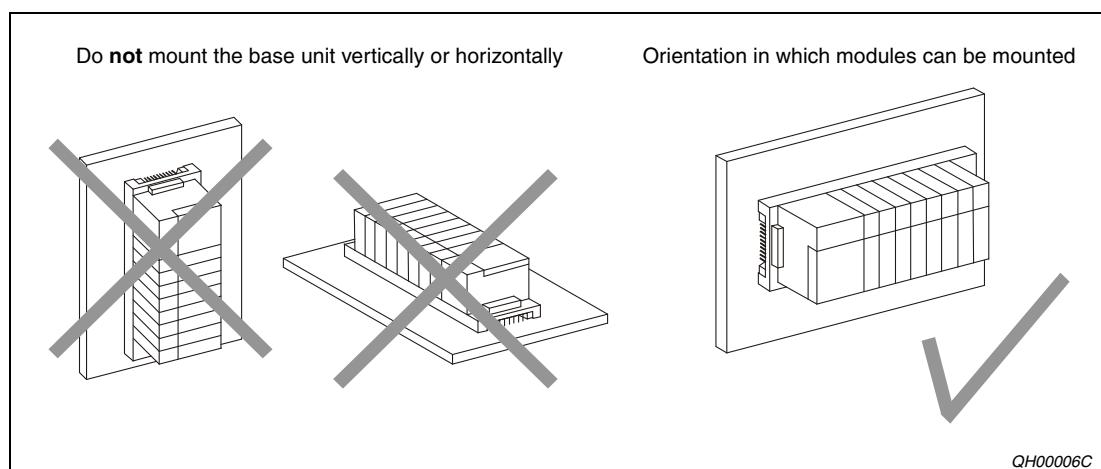

- Keep the clearances shown in following figure between the top/bottom faces of the module and other structures or parts to ensure good ventilation and facilitate module replacement.

**Fig. 9-5: Module mounting position**

- ① For wiring duct with 50 mm or less height.  
40 mm or more for other cases.
- ② Depending on length of extension cable.
- ③ 45 mm or more when the Q7BAT is mounted.

- Do not mount the devices vertical or flat because the ventilation is not sufficient in this case.

**Fig. 9-6: Module mounting orientation**

- Mount the base unit on a flat surface. If the mounting surface is not even, this may strain the printed circuit boards and cause malfunctions.

- Avoid mounting base unit in proximity to vibration sources such as large magnetic contactors and no-fuse circuit breakers; mount these on a separate panel or at a distance.

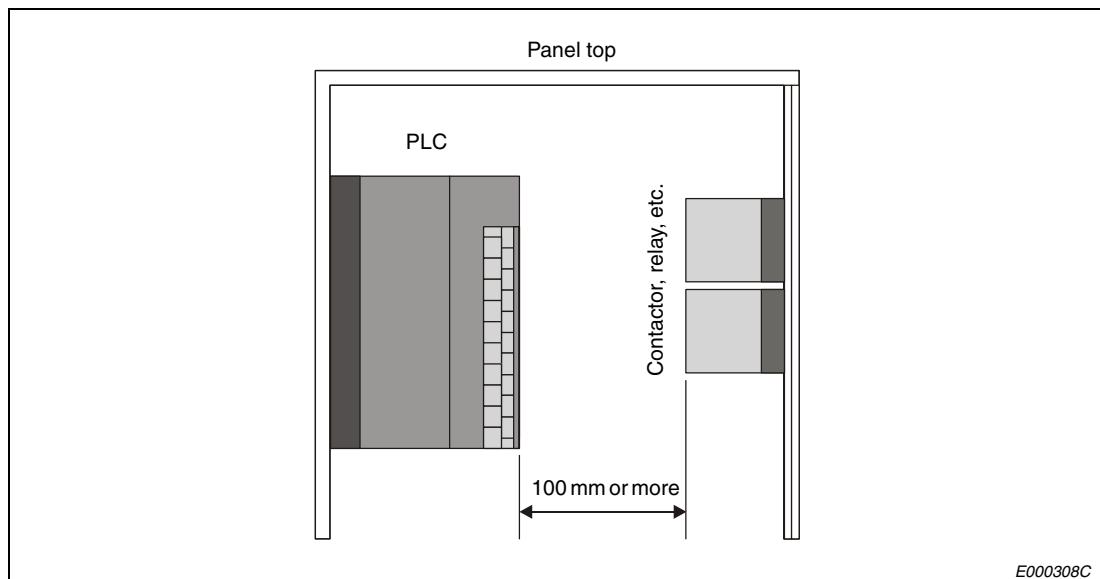

- Install wiring ducts with sufficient dimensions.

If the wiring duct is mounted above the PLC, the depth of the wiring duct should be maximum 50 mm, so that the ventilation is not affected.

Keep enough distance to the controller that cables and modules can be easily replaced in future.

If the wiring duct is mounted below the PLC, give enough space for the power supply input cables (100/230 V AC) and for the cables to the I/O modules.

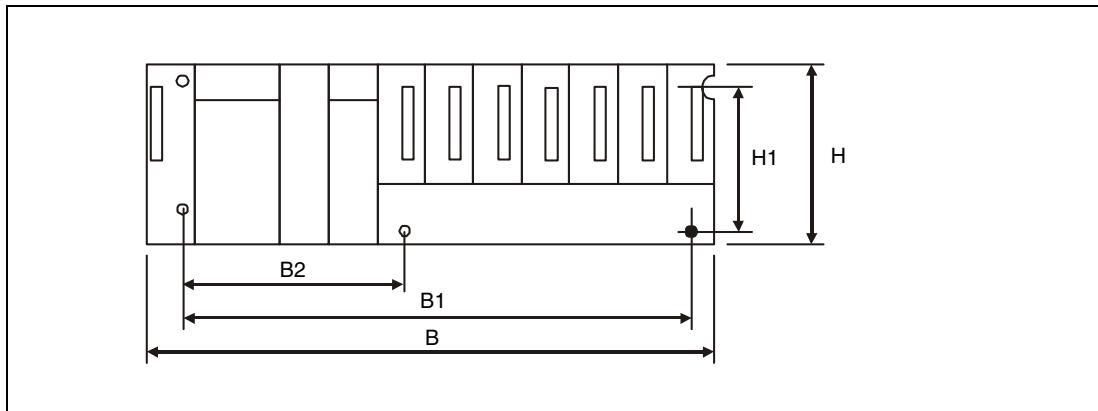

- In order to avoid the effects of radiated noise and heat inside the cabinet, provide a clearance of minimum 100 mm between the PLC and devices that generate noise or heat (contactors and relays). The device could be mounted on the internal side of the cabinet. The required clearance of the device on the right and left side of the PLC is minimum 50 mm.

**Fig. 9-7:** Distances from the other devices in the panel

## 9.4.1 Direct mounting

The main base units can be mounted directly on the backside panel of the cabinet. The following tables show the distances of the mounting holes.

**Fig. 9-8:** Base units external dimensions

| Value | External dimensions [mm] |       |      |       |       |       |       |       |        |       |
|-------|--------------------------|-------|------|-------|-------|-------|-------|-------|--------|-------|
|       | Q33B                     | Q35B  | Q38B | Q312B | Q32SB | Q33SB | Q35SB | Q38DB | Q312DB | Q38RB |
| B     | 189                      | 245   | 328  | 439   | 114   | 142   | 194   | 328   | 439    | 439   |
| B1    | 169                      | 224.5 | 308  | 419   | 101   | 129   | 184.5 | 308   | 419    | 419   |
| B2    | —                        | —     | 170* | 170*  | —     | —     | —     | 170   | 170    | 170   |
| H     | 98                       |       |      |       |       |       |       |       |        |       |
| H1    | 80                       |       |      |       |       |       |       |       |        |       |

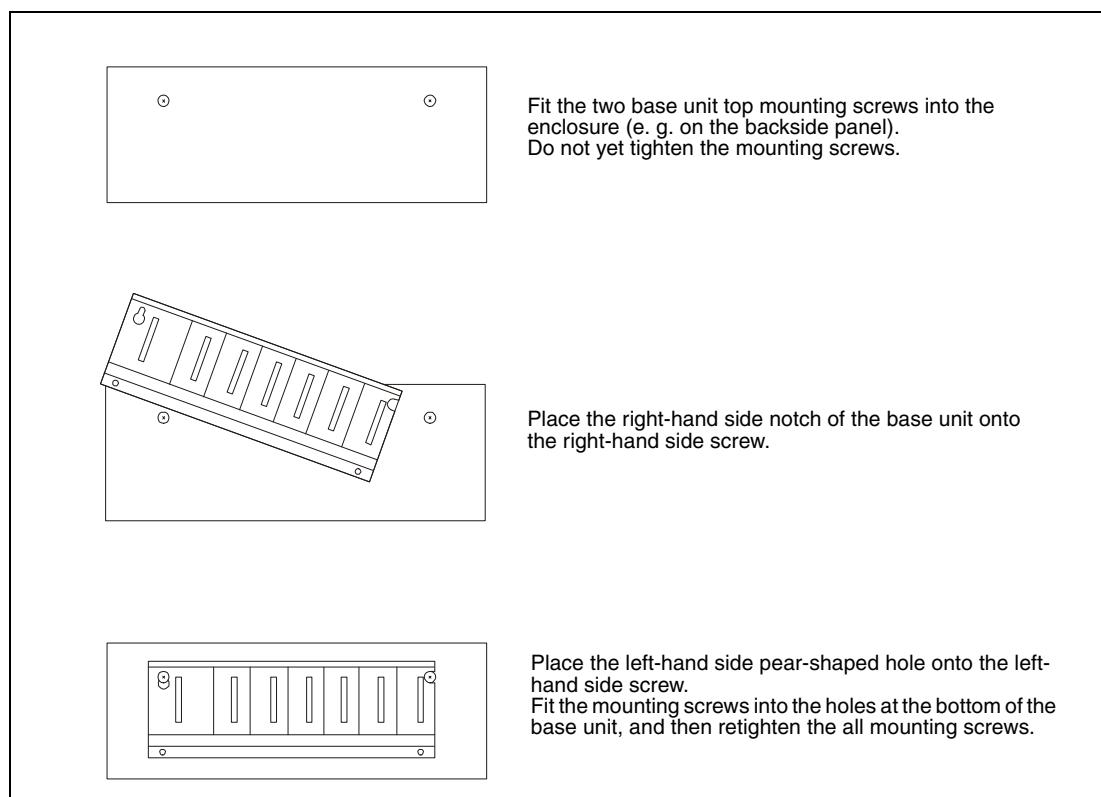

**Tab. 9-1:** Main base units external dimensions

\* Base units with 4 or 5 base mounting holes are available. This value applies for base units with 5 base mounting holes only.

| Value | External dimensions [mm] |      |      |       |      |       |       |        |
|-------|--------------------------|------|------|-------|------|-------|-------|--------|
|       | Q52B                     | Q55B | Q63B | Q65B  | Q68B | Q612B | Q68RB | Q65WRB |
| B     | 106                      | 189  | 189  | 245   | 328  | 439   | 439   | 439    |
| B1    | 83.5                     | 167  | 167  | 222.5 | 306  | 417   | 417   | 417    |
| B2    | —                        | —    | —    | —     | 190* | 190*  | 170   | 170    |
| H     | 98                       |      |      |       |      |       |       |        |
| H1    | 80                       |      |      |       |      |       |       |        |

**Tab. 9-2:** Main base units external dimensions

\* Base units with 4 or 5 base mounting holes are available. This value applies for base units with 5 base mounting holes only.

**Fig. 9-9:** Installing a main base unit, or a Q00U(J)CPU

**NOTES**

Install the main base unit with Q00UCPU or Q00UJCPU to the panel of a cabinet, with no module mounted in the rightmost slot.

Remove the base unit from the panel after removing the module from the rightmost slot.

The mounting screws (cross recessed head bind screw M4x12) provided with the slim type main base unit Q32DB, Q33SB and Q35SB differ from those provided with other types of the base unit.

## 9.4.2 Mounting a DIN rail

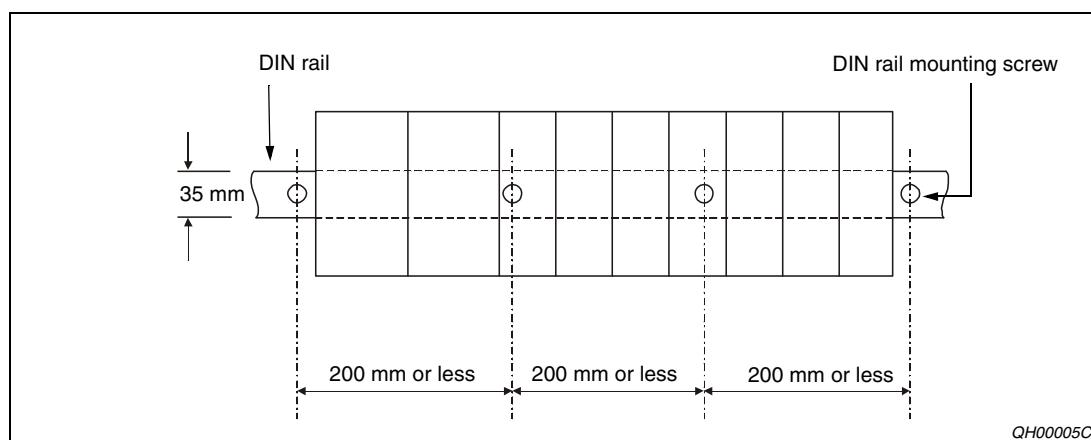

For mounting of main or extension base unit on a DIN rail with 35 mm width, use appropriate adapters.

| Application         | DIN rail mounting adapters           |        |                              |
|---------------------|--------------------------------------|--------|------------------------------|
|                     | Q6DIN1                               | Q6DIN2 | Q6DIN3                       |
| Main base unit      | Q38B, Q38DB, Q38RB,<br>Q312B, Q312DB | Q35B   | Q33B, Q32SB, Q33SB,<br>Q35SB |
| Extension base unit | Q68B, Q612B, Q68RB,<br>Q65WRB        | Q65B   | Q52B, Q55B, Q63B             |

**Tab. 9-3:** Adapters for mounting a DIN rail to the base unit

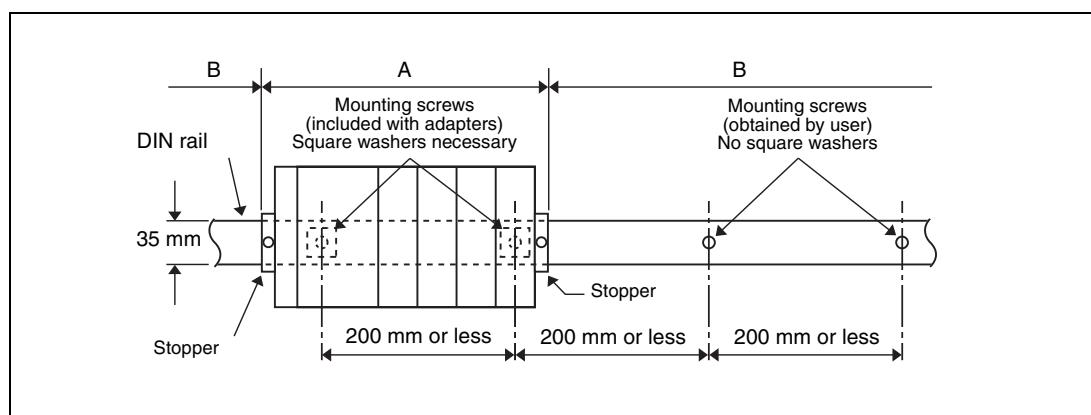

### DIN rail mounting

When using DIN rail, DIN rail mounting screws must be inserted in 200 mm distances or less in order to ensure that the rail has sufficient strength.

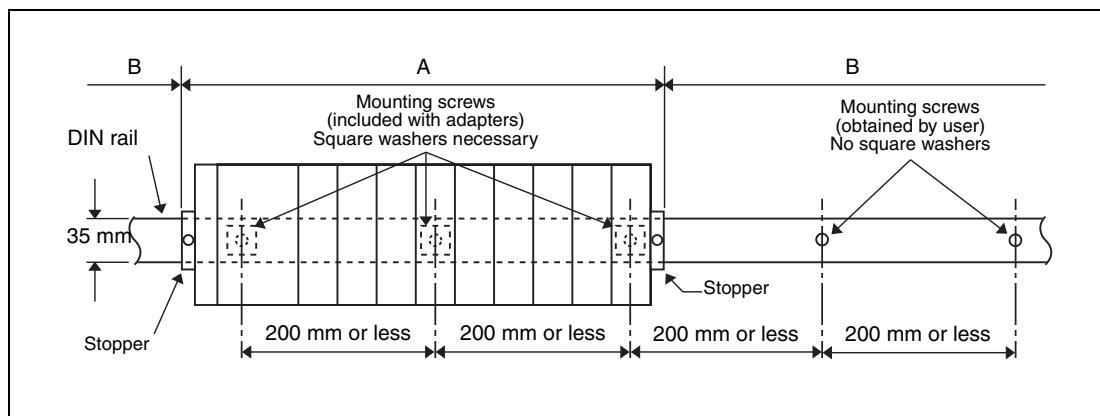

**Fig. 9-10:** DIN rail mounting

When installing the DIN rail in a frequent vibration and/or shock prone environment, insert the mounting screws in 200 mm intervals or less by the following method shown in the figures below.

**Fig. 9-11:** DIN rail mounting for Q00JCPU or Q00UJCPU and the base units Q33B, Q35B, Q65B, Q52B, Q55B, Q63B, Q32SB, Q33SB and Q35SB

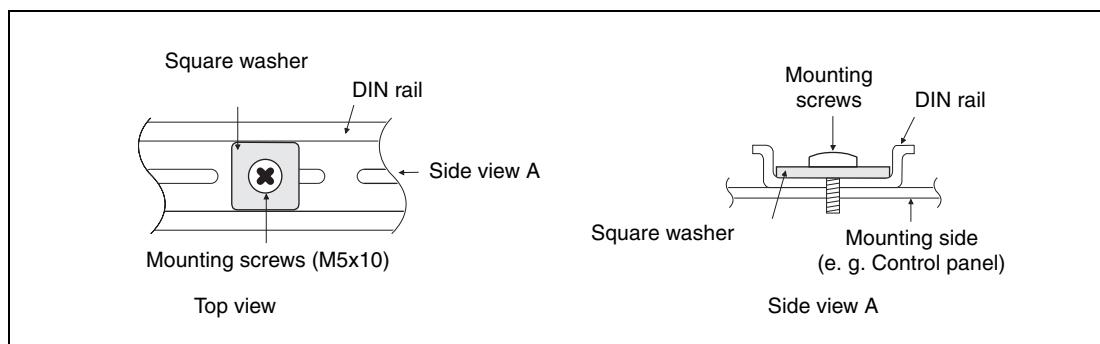

**Fig. 9-12:** DIN rail mounting for the base units Q38B, Q312B, Q68B, Q612B, Q38RB, Q68RB, Q65WRB, Q38DB and Q312DB

Screw the DIN rail in two places using the mounting screws and square washers included with the adapters in 'Position A' (bottom of base unit).

Screw the DIN rail with mounting screws (obtained by user) in 'Position B' (where the base unit is not installed).

The following shows where to position the square washers and the mounting screws included with adapters.

**Fig. 9-13:** DIN rail mounting, when there is large vibration or impact

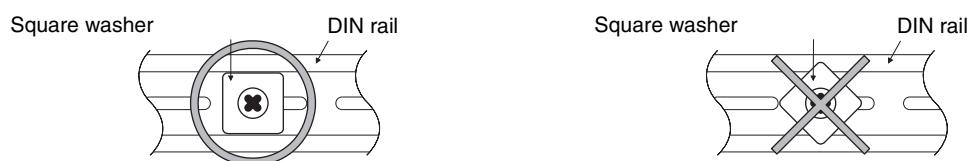

#### NOTES

Use the DIN rail that is compatible with M5 size screws.

Use only one washer for each mounting screw. Use only the square washers supplied with the adapters.

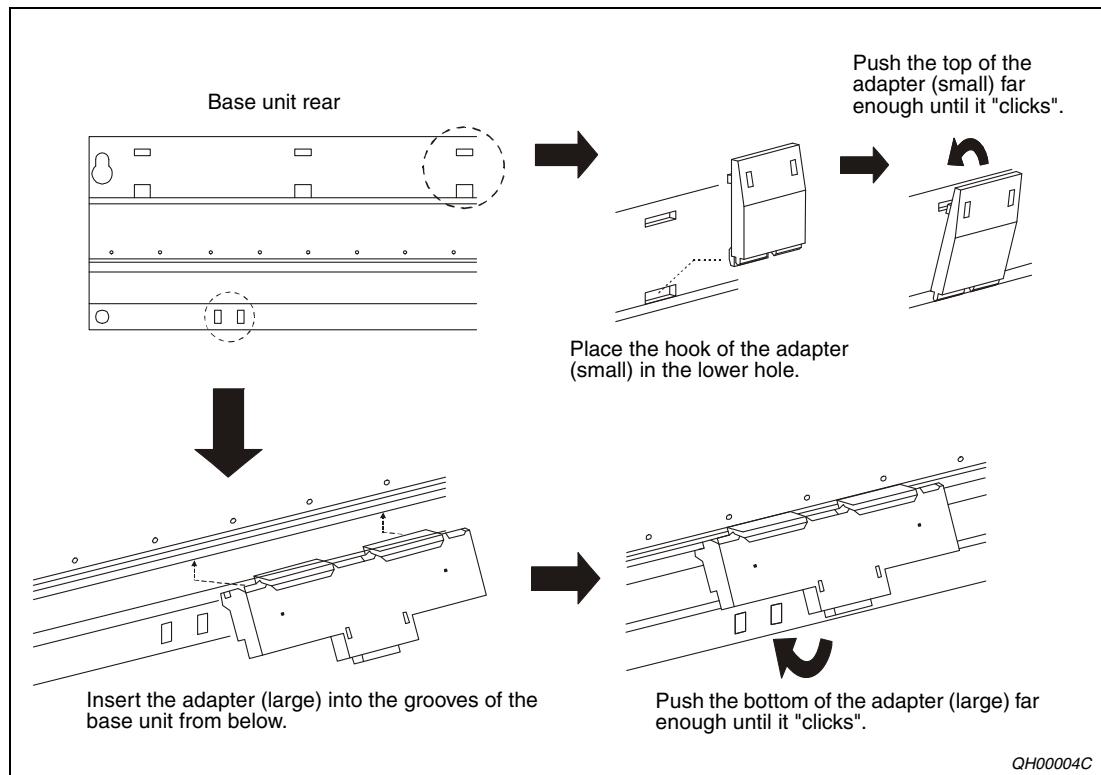

If two or more washers are used together for one mounting screw, the screw may interfere with the base unit.

Make sure to align the square washer sides with the DIN rail.

**Adapter installation method**

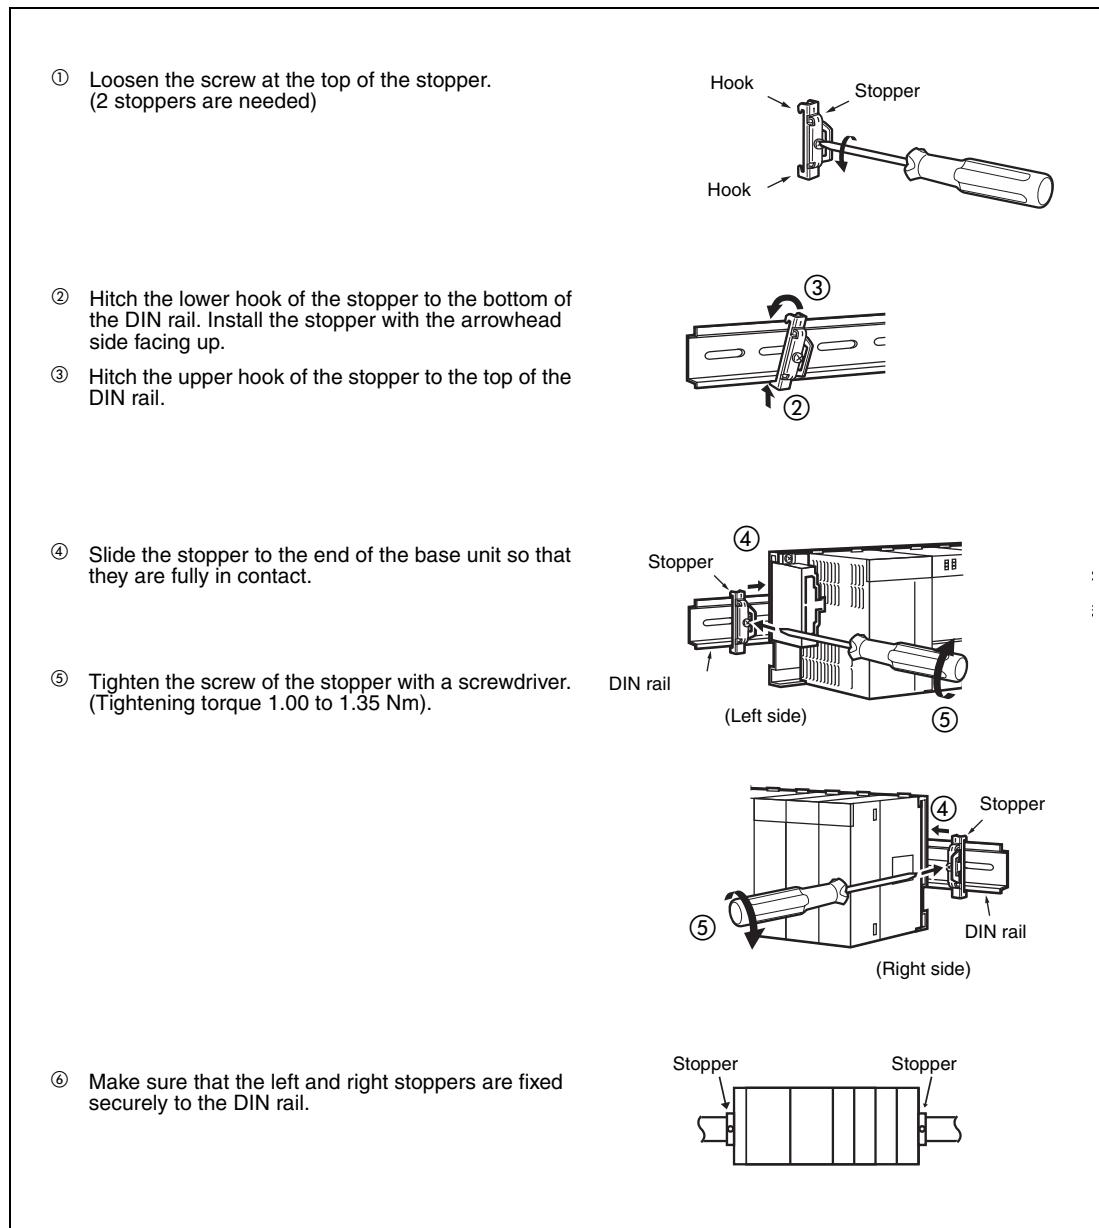

The way to install the adapters for mounting a DIN rail to the base unit is given in following figure.

**Fig. 9-14: Adapter installation method**

### Stopper mounting

When using the DIN rail in frequent vibration and/or shock prone environment, use stoppers included with the DIN rail mounting adapter.

**Fig. 9-15: Stopper mounting procedure**

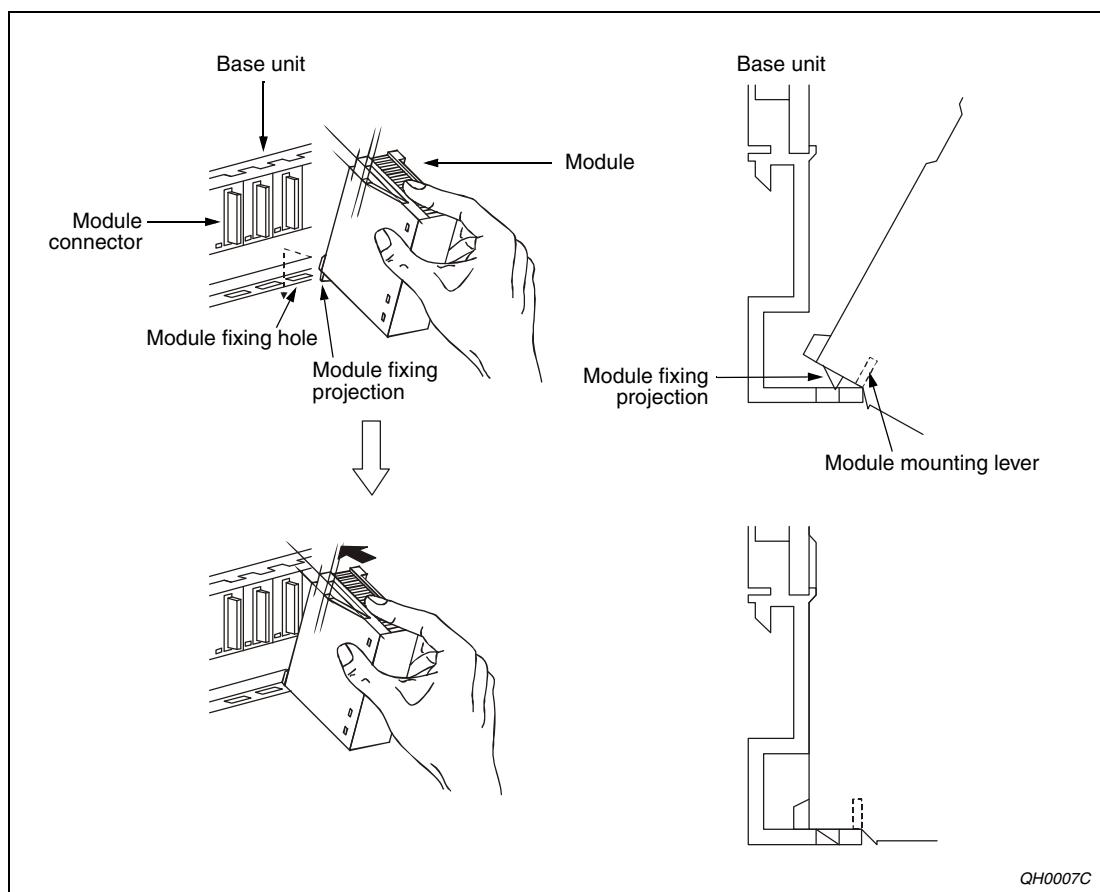

## 9.5 Installation and removal of module

**CAUTION:**

- *Shut off the external power supply for the system in all phases before mounting or removing the module.*
- *Always insert the module fixing latch of the module into the module fixing hole. Forcing the hook into the hole will damage the module connector and module.*

**Installation**

- Shut off the external power supply!
- Securely insert the module fixing projection into the module fixing hole so that the latch is not misaligned.
- Using the module fixing hole as a supporting point, push the module in the direction of arrow until it clicks.
- When using the programmable controller in an environment of frequent vibration or impact, secure the CPU module to the base unit using screws (module fixing screw M3x12, user-prepared).

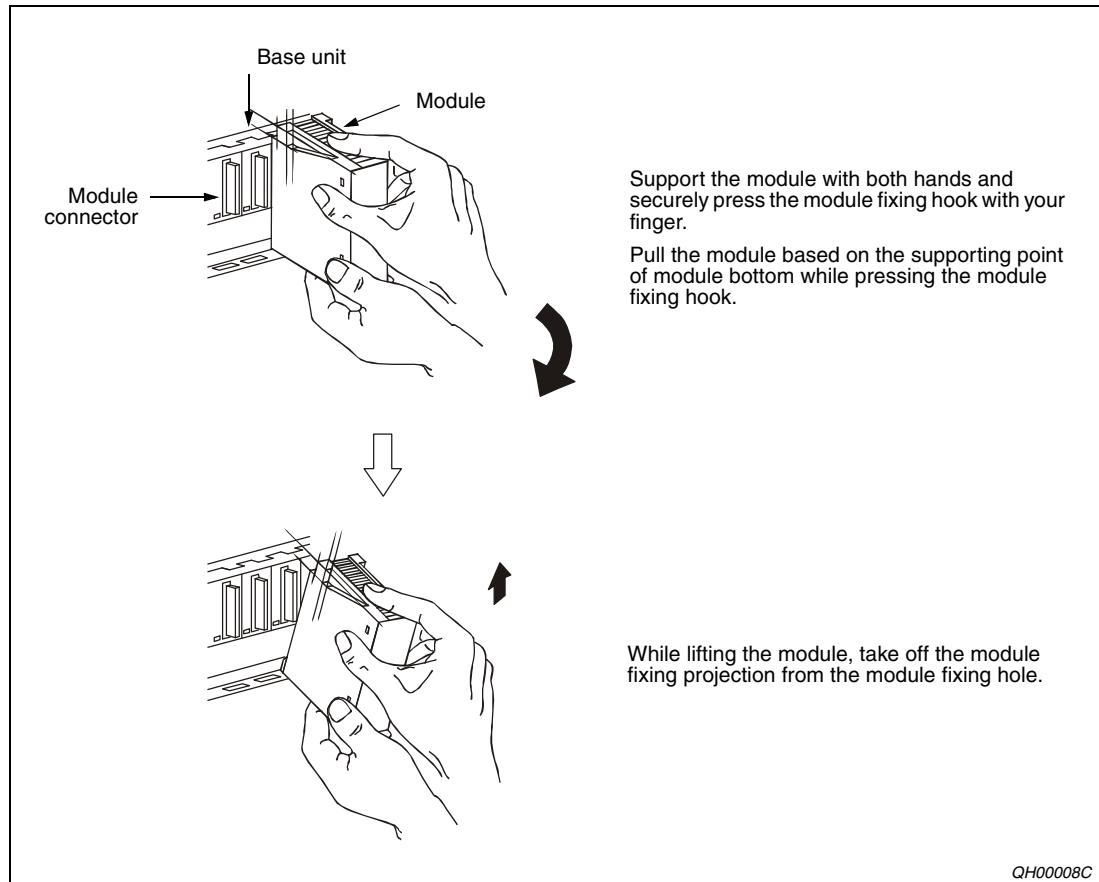

**Fig. 9-16: Module mounting procedure**

### Removal

**CAUTION:**

- **Shut off the external power supply for the system before removing the module.**
- **When removing the module which is secured by module fixing screw, remove the module fixing screw first and then module fixing projection off the module fixing hole of the base unit. Failure to do so may damage the module fixing projection.**

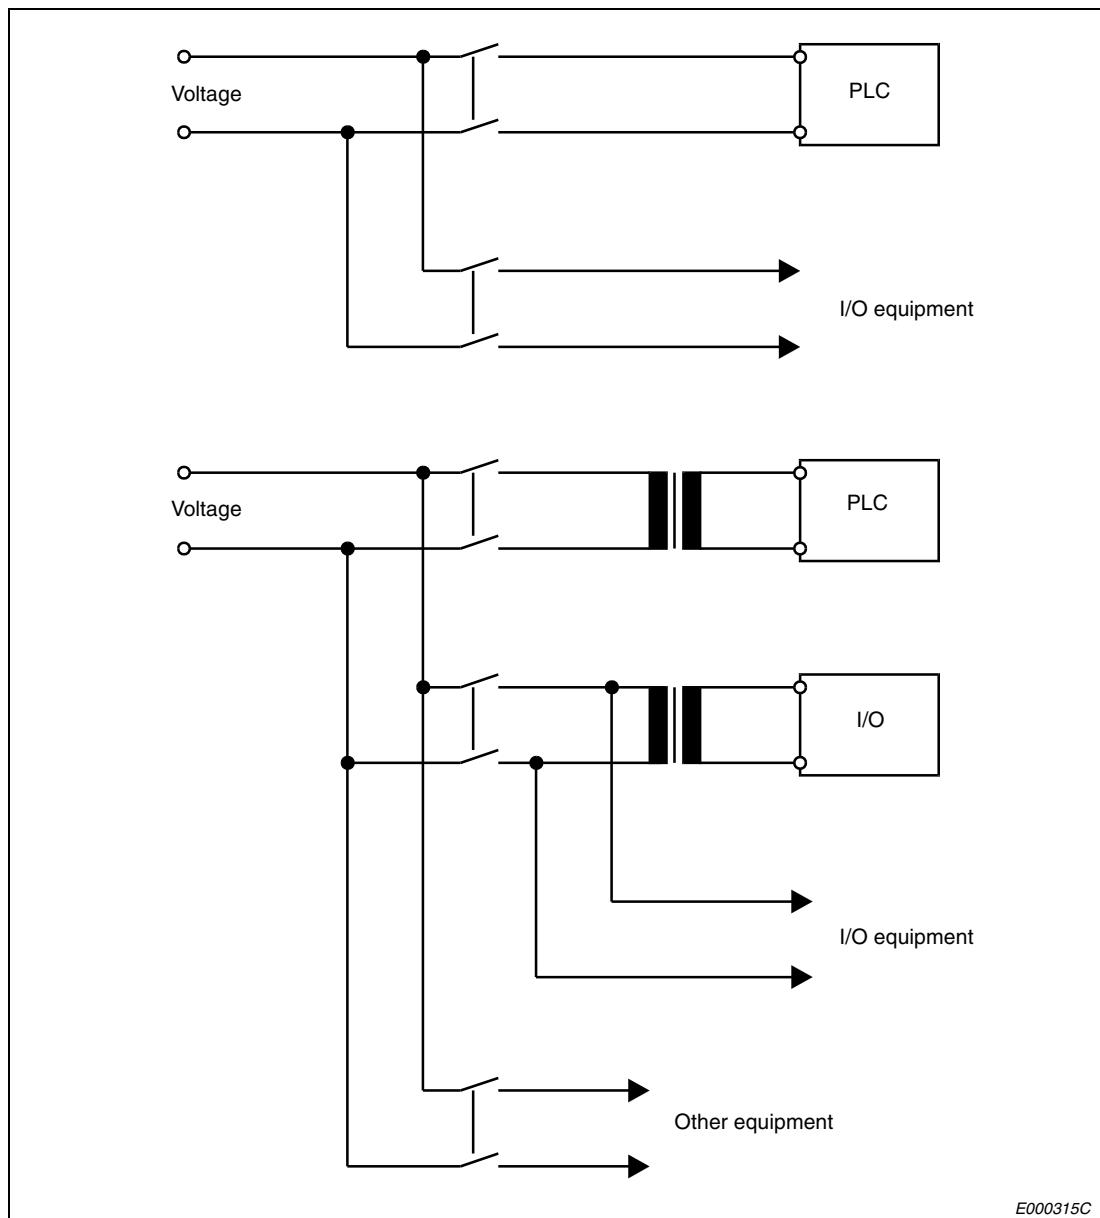

**Fig. 9-17: Module removal procedure**

## 9.6 Wiring

### 9.6.1 Wiring precautions

#### Wiring power supply lines

- Wire the power supply lines for programmable controller, I/O devices, and other equipment separately.

*Fig. 9-18: Separate power supplies for PLC and peripheral equipment*

- Power supply cables (110 V AC, 230 V AC) and DC cables should be bundled in separated strings. Bundling can be done by cable twisting or wire straps. Connect the modules with the shortest distance.
- To reduce the voltage drop to the minimum, use the thickest wires possible (max. 2 mm<sup>2</sup>) for 110 V AC, 230 V AC and 24 V DC wires.
- Do not bundle the 110 V AC and 24 V DC wires with, or run them close to, the main circuit (high voltage, large current) and I/O signal lines (including common line). Reserve a distance of at least 100 mm from adjacent wires.
- As measures against surge (e.g. caused by lightning), connect a surge absorber for lightning:

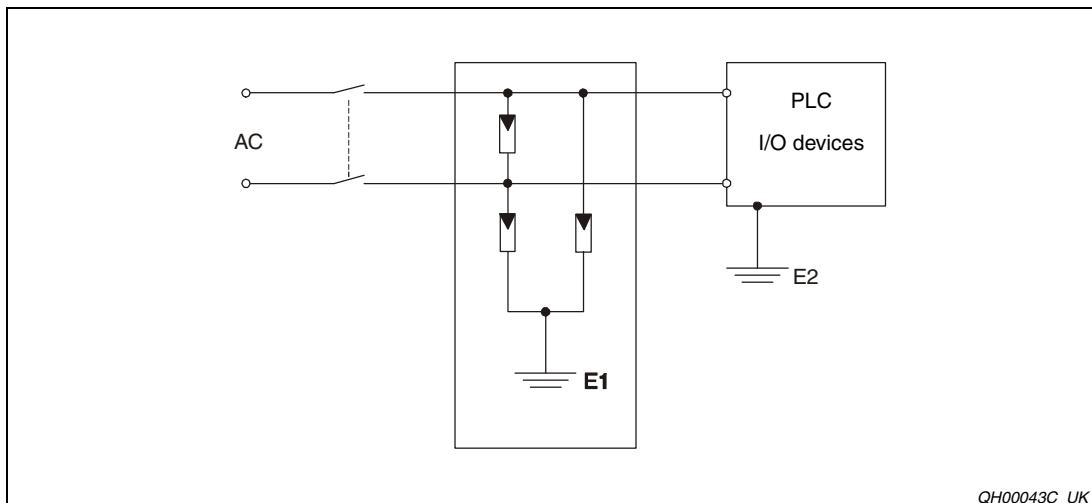

Fig. 9-19: Connecting a lightning surge absorber

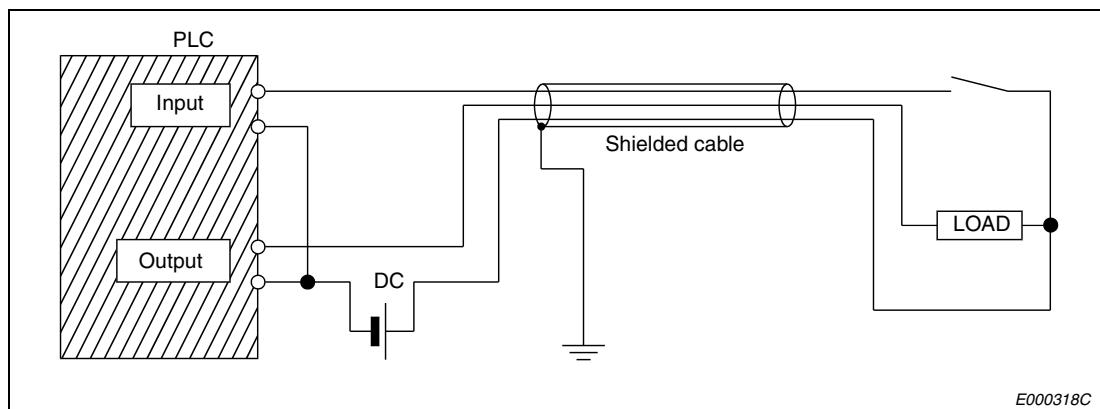

**CAUTION:**

- Separate the ground of the surge absorber for lightning (E1) from that of the programmable controller (E2).
- Select a surge absorber for lightning whose power supply voltage does not exceed the maximum allowable circuit voltage even at the time of maximum power supply voltage elevation.

**Wiring of I/O equipment**

- The wires used for connection to the terminal block must be 0.3 to 0.75 mm<sup>2</sup> in core.
- Run the input and output lines away from each other.
- Do not lay I/O signal cables close to the main circuit and high-voltage power lines. Keep a safe distance of more than 100 mm from the above.
- When the input and output lines cannot be run away from the main circuit and power lines, use a batch-shielded cable. Normally the shield of the shielded cable must be grounded on the module side.

**Fig. 9-20: Wiring of I/O equipment**

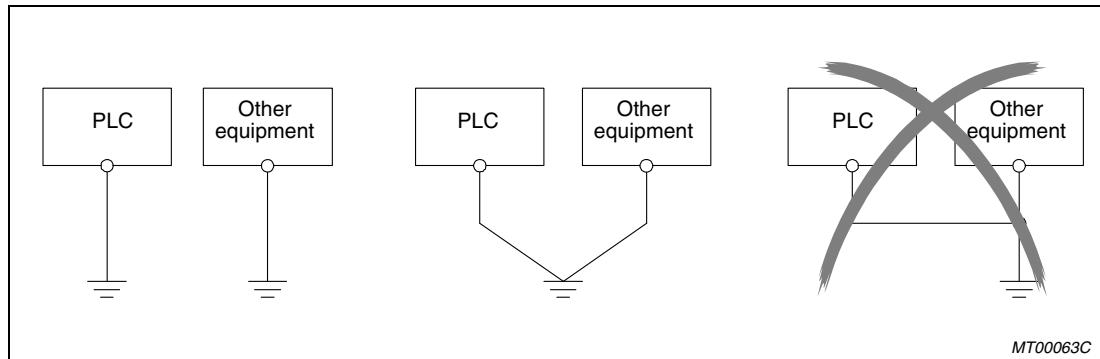

- Where wiring runs through piping, ground the piping.
- Run the 24 V DC input line away from the 110 V AC and 230 V AC lines.

**NOTE**

Wiring of 200 m or longer will raise current leakage due to the line capacity, resulting in a fault.

### Grounding

- Use a dedicated grounding wire as far as possible (see fig. 9-21, left example). Grounding is done according class 3 (grounding resistance 100 Ω or less).

**Fig. 9-21: Grounding procedures**

- When a dedicated grounding cannot be provided, use common grounding as shown in the center of Fig. 9-21. Do not use the grounding as shown in the right example.
- If failures occur during operation due to grounding, cut the LG and FG terminals of the main base unit from ground.
- For grounding a cable, use the cable of 2 mm<sup>2</sup> or more. Position the ground-contact point as close as possible to the programmable controller (length of the grounding cable 30 cm or less).

### Shielding

For the communication of a MELSEC system with peripheral equipment shielded data lines have to be used only. At best, the shielding is made of twisted copper. The density of the braiding determines the effectiveness of the shielding. Make sure to follow the bending instructions of the cable manufacturer, otherwise the shielding might fan out. Connect the shielding of the data line only at one side to ground. Do not solder any wires with the shielding.

### Analogue signal transmission

Use 2-wire shielded cables for low frequency analogue transmission over short distances. Between sensor and receiver could occur potential differences on the reference conductor. Therefore use isolating components like transformers, opto couplers etc.

### Digital signal transmission

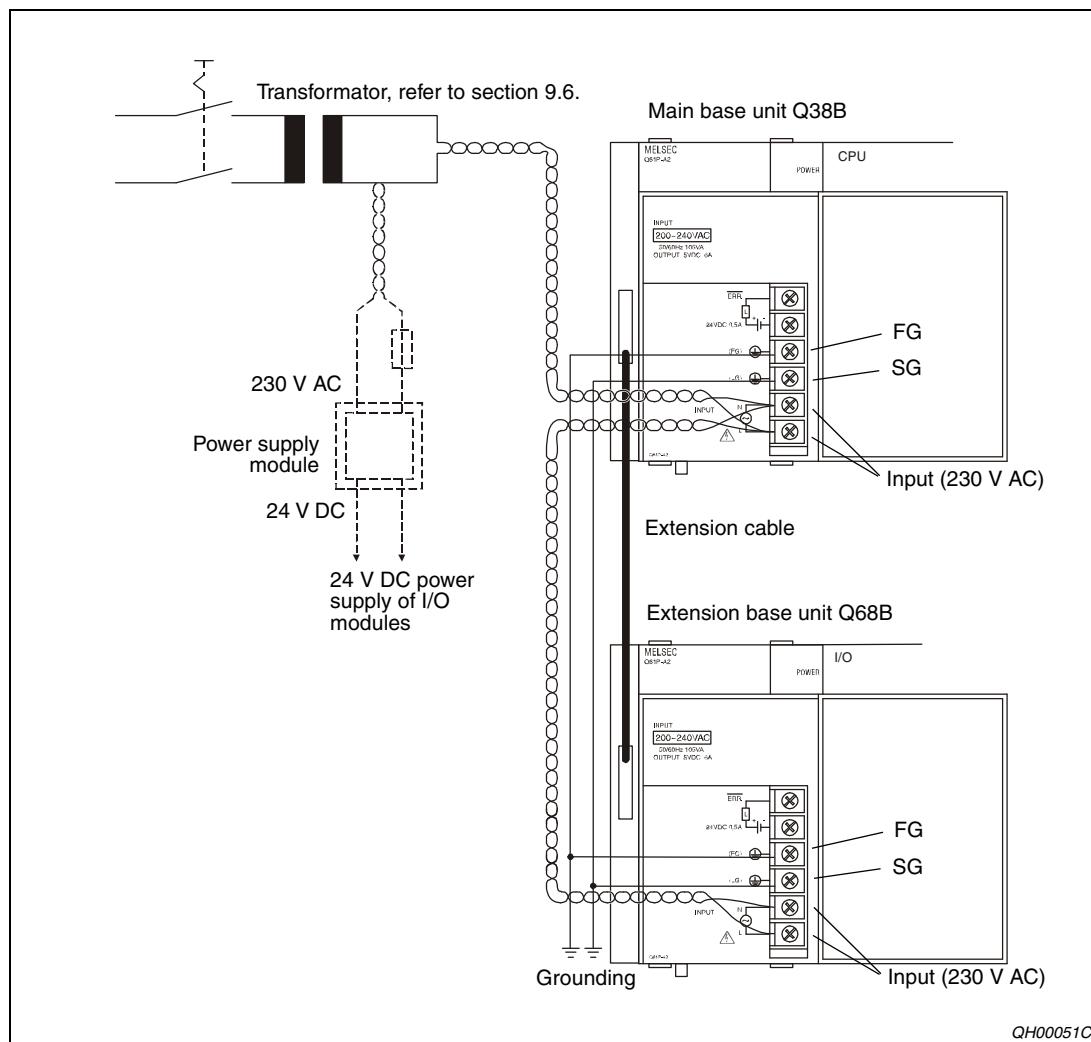

Follow the specifications of the interface concerning transfer rate and transfer distance, for an error free digital signal transmission.

### Connecting to the power supply module

**CAUTION:**

- Use the thickest possible (max. 2 mm<sup>2</sup>) wires for the 110/230 V AC and 24 V DC power cables. Twist these wires starting at the connection terminals. To prevent short-circuit due to loosening screws, use the solderless terminals with insulation sleeves.
- When LG and FG terminals are connected, ground the wires. Connect both terminals only with ground. If LG and FG terminals are connected without grounding the wires, the programmable controller may become susceptible to noise. Since the LG terminal is not isolated there is the danger of an electrical shock, when touching conducting parts or surfaces.

The following figure shows the wiring example of lines such as power lines and grounding lines to the main base unit and extension base units. Please refer to the notes for wiring the power supplies in section 7.4.

**Fig. 9-22: Single power supply system wiring example**

# 10 Maintenance and inspection

In order to use the programmable controller in normal and optimal condition at all times, this section describes items that must be maintained or inspected daily or at regular intervals.

## 10.1 Daily inspection

The items that must be inspected daily are listed in the following table:

| Inspection item            | Inspection  | Judgment criteria   | Measures   |
|----------------------------|---|---|--|
| Installation of base unit  | Check that fixing screws are not loose and the cover is not dislocated.               | The screws and cover must be installed securely                     | Retighten the screws.  |
| Installation of I/O module | Check that the module is not dislocated and the unit fixing hook is engaged securely. | The module fixing hook must be engaged and installed securely.      | Securely engage the module fixing hook.  |
| Connecting conditions      | Check for loose terminal screws.  | Screws must not be loose.   | Retighten the terminal screws.   |
|                            | Check for distance between solderless terminals.                                      | The proper clearance must be provided between solderless terminals. | Correct.   |
|                            | Check that the cable connector is not loose.  | Connections must not be loose.                                      | Retighten the connector fixing screws.   |
| Module indication LED      | POWER LED   | Check that the LED is on.   | The LED must be on (green). (Error if the LED is off or on (red)).<br>refer to section 11.2.4  |
|                            | RUN LED   | Check that the LED is on in the RUN status.                         | The LED must be on. (Error if the LED is off/flickering.)<br>refer to sections 11.2.8 and 11.2.9   |
|                            | ERR.LED   | Check that the LED is off.  | The LED must be off. (Error detected if the LED is on.)<br>refer to sections 11.2.10 and 11.2.11   |
|                            | BAT. LED  | Check that the LED is off.  | The LED must be off. (Error if the LED is on.)<br>refer to section 11.2.12   |
|                            | Input LED   | Check that the LED turns on and off.                                | The LED must be on when the input power is turned on. The LED must be off when the input power is turned off.<br>(Error if the LED does not turn on or turn off as indicated above.)<br>refer to section 11.4    |
|                            | Output LED  | Check that the LED turns on and off.                                | The LED turns on when the output power is turned on. The LED must be off when the output power is turned off.<br>(Error if the LED does not turn on or turn off as indicated above.)<br>refer to section 11.2.15 |

**Tab. 10-1: Daily inspection**

## 10.2 Periodic inspection

The items that must be inspected one or two times every 6 months to 1 year are listed below. When the equipment has been relocated or modified, or wiring layout has been changed, perform this inspection.

| Inspection item         |   | Inspection  | Judgment criteria  | Measures  |
|-------------------------|---|---|--|---|
| Ambient environment     | Ambient temperature                                     | Measure with a thermometer and a hygrometer. Measure corrosive gas. | 0 to 55 °C   | When the sequencer is used in the board, the ambient temperature in the board is relevant.  |
|                         | Ambient humidity  |   | 5 to 95 % RH   |   |
|                         | Atmosphere  |   | Corrosive gas must not be present.   |   |
| Power voltage           |   | Measure the voltage between the terminals (power supply module)     | 85 to 132 V AC<br>170 to 264 V AC<br>15.6 to 31.2 V DC   | Change the power supply or replace the transformer  |
| Installation of modules | Looseness, rattling                                     | Move the module to check for looseness and rattling.                | The module must be installed securely.   | Retighten the screws. If the CPU, I/O, or power supply module is loose, fix it with screws.   |
|                         | Adhesion of dirt and foreign matter                     | Check visually.   | Dirt and foreign matter must not be present.   | Remove and clean.   |
| Connections             | Looseness of terminal screws                            | Check for loose terminal screws.                                    | Screws must not be loose.  | Retighten the terminal screws.  |
|                         | Proximity of solderless terminals to each other         | Check visually.   | Solderless terminals must be positioned at proper intervals.                                   | Correct.  |
|                         | Looseness of connectors                                 | Check visually.   | Connectors must not be loose.  | Retighten the connector fixing screws.  |
| Battery                 | Check the BAT. LED at the front side of the CPU module. |   | The LED must be off.   | Replace the battery when the BAT. LED is on.  |
|                         | Check the length of term after purchasing the battery.  |   | Must not be used more than 5 years.  | Replace the battery if it has been used more than 5 years (even if there is no voltage drop).   |
|                         | Check status of SM51 and SM52                           |   | Must be turned off (refer to section 10.3.1)   | Replace the battery when SM51 or SM52 is on.<br>The special registers SD51 and SD52 indicate the specific battery of the memory of which voltage is lowered.                |
| PLC diagnostics         |   | Check the Error log.  | The Error log must not be updated.   | refer to section 11.3   |
| Maximum scan time       |   | Check the values of SD526 and SD527 using a programming device      | Maximum scan time must be within the allowable range given in the specification of the system. | Specify factors that increase the scan time. (Check the operation status of the trigger signal that passes through a loop if loop positions exist in the sequence program.) |

**Tab. 10-2: Periodic inspection**

## 10.3 Battery life and replacement procedure

The batteries installed in the CPU module and SRAM card are used for data retention of the program memory, standard RAM, and latch device during the power failure. Special relays SM51 and SM52 turn on due to the battery voltage drop. Even if the special relays turn on, the program and retained data are not deleted immediately (refer to section 10.3.1). But if the special relays are not observed, the contents of the buffered memory may be lost.

**NOTE**

- After relay SM51 turns on, replace the battery as quickly as possible.
- When the battery-low special relay SM52 turns on, immediately change the battery.

SM51 and SM52 turn on when the battery voltage of the CPU module or SRAM card is lowered. To identify the specific battery of the memory of which voltage is lowered, check the contents of the special registers SD51 and SD52.

|                       | Special registers SD51 and SD52 |       |                        |
|-----------------------|---------------------------------|-------|------------------------|
|                       | Bit 2                           | Bit 1 | Bit 0                  |
| Status indication for | Battery for SRAM card           |       | Battery for CPU module |

**Tab. 10-3:** Bit pattern SD51 and SD52

The cases for memory retention by the CPU module battery and the SRAM card battery are described below. The important points are:

- The CPU module battery **cannot** retain the SRAM card memory.
- The SRAM card battery cannot retain the CPU module memory.

| Power supply module | Voltage of buffer battery for CPU | Voltage of buffer battery for SRAM memory card | Memory retention |           |
|---------------------|-----------------------------------|--|------------------|-----------|
|                     |                                   |  | CPU              | SRAM card |

**Tab. 10-4:** Memory retention

● = retained

— = not retained

### 10.3.1 Battery life

#### Buffer battery for CPU

The battery life depends on the CPU type. From Q02CPU on, the battery life is also determined by the CPU version (serial number). Refer to section 4.6 for checking the CPU serial number.

##### NOTES

- When the battery (Q6BAT) is not connected to the CPU module, its service life is five years. Replace the battery after this time.
- Do not use the battery exceeding the guaranteed value of the battery life.
- If the battery life for data buffering has expired the guaranteed time of the following table,
  - store program and data into a ROM, so that the data don't get lost, if the PLC is powered down or the battery voltage is low,
  - during the time given in the right column of the following table, save program and data on a PC, after special relay SM52 is set.
- When the battery-low special relay SM52 turns on, immediately change the battery.

#### Extending the battery life with the universal model CPU

The universal model CPU has a pro-longing function to extend the battery life. When setting "switch 3" of the intelligent function module switch setting on the tab "I/O assignment", to the value 0001H, only the internal clock is buffered by the battery. All other data, which are normally buffered by the battery get lost during power shut off.

The current supplied by the battery for these CPU modules, what means the battery consumption, is divided in four categories:

| Factors of battery consumption   |   | Battery consumption category |
|----------------------------------|---|------------------------------|
| Battery life-prolonging function | Size of file register file in standard RAM ( $S_R$ )    |                              |
| Set                              | —   | 1                            |
| Not set                          | No file registers or 0 k words < $S_R \leq$ 128 k words | 2                            |
|                                  | 128 k words < $S_R \leq$ 384 k words                    | 3                            |
|                                  | 384 k words < $S_R$                                     | 4                            |

**Tab. 10-5: Factors influencing the battery life time**

The following describes measures for reducing battery consumption:

- Enable the battery life-prolonging function.
- When storing a file register in standard the RAM, minimize the file register file.
- By performing the latch data backup function (to standard ROM).

If not powering on the programmable controller for a long period of time for shipment or other reason, back up the data to the standard ROM.

**Tab. 10-6: Battery (Q6BAT) lives of Q00JCPU, Q00CPU or Q01CPU**

- ① The power-on time ratio indicates the ratio of programmable controller power-on time to one day (24 hours). When the total power-on time is 12 hours and the total power-off time is 12 hours, the power-on time ratio is 50 %.
- ② The guaranteed value represents a battery life at 70 °C, which is calculated based on the characteristic values of manufacturer-supplied memories (SRAM) and on the assumption of storage within the ambient temperature range of –25 °C to 75 °C (operating ambient temperature of 0 °C to 55 °C).
- ③ The actual service value (reference value) represents a battery life that is calculated based on the values measured at storage ambient temperature of 40 °C. This value is intended for reference only, as it varies with characteristics of the memory.
- ④ In the following status, the backup time after power off is 3 minutes:
  - The battery connector is disconnected.
  - The lead wire of the battery is broken.

**Tab. 10-8: Battery (Q6BAT) lives of High performance model QCPU (first digits of serial No. is "05011..." or later), Process CPU and Redundant CPU**

- ① The power-on time ratio indicates the ratio of programmable controller power-on time to one day (24 hours). When the total power-on time is 12 hours and the total power-off time is 12 hours, the power-on time ratio is 50 %.
- ② The guaranteed value represents a battery life at 70 °C, which is calculated based on the characteristic values of manufacturer-supplied memories (SRAM) and on the assumption of storage within the ambient temperature range of -25 °C to 75 °C (operating ambient temperature of 0 °C to 55 °C).
- ③ The actual service value (reference value) represents a battery life that is calculated based on the values measured at storage ambient temperature of 40 °C. This value is intended for reference only, as it varies with characteristics of the memory.
- ④ In the following status, the backup time after power off is 3 minutes:
  - The battery connector is disconnected.
  - The lead wire of the battery is broken.

|  | 100 %                 |                                | 43800 hours<br>(5 years)    |   |                        |

**Tab. 10-9: Battery (Q6BAT) lives of the Universal model QCPU**

- ① The power-on time ratio indicates the ratio of programmable controller power-on time to one day (24 hours). When the total power-on time is 12 hours and the total power-off time is 12 hours, the power-on time ratio is 50 %.
- ② refer to Tab. 10-5
- ③ The guaranteed value represents a battery life at 70 °C, which is calculated based on the characteristic values of manufacturer-supplied memories (SRAM) and on the assumption of storage within the ambient temperature range of -25 °C to 75 °C (operating ambient temperature of 0 °C to 55 °C).
- ④ The actual service value (reference value) represents a battery life that is calculated based on the values measured at storage ambient temperature of 40 °C. This value is intended for reference only, as it varies with characteristics of the memory.
- ⑤ In the following status, the backup time after power off is 3 minutes:
  - The battery connector is disconnected.
  - The lead wire of the battery is broken.

## Battery Q7BAT

### NOTES

- When the battery (Q7BAT) is not connected to the CPU module, its service life is five years. Replace the battery after this time.
- Battery Q7BAT is not available in EU countries.
- The battery Q7BAT is not available for the Basic model QCPU (00JCPU, Q00CPU and Q01CPU).
- Q02(H)-, Q06H-, Q12H- or Q25HCPU (first digits of serial No. is "05010..." or earlier)

| CPU                | Power-on time ratio ① | Battery life (Q7BAT)        |                             |                      |

**Tab. 10-12:**Battery (Q7BAT) lives of the Universal model QCPU

- ① The power-on time ratio indicates the ratio of programmable controller power-on time to one day (24 hours). When the total power-on time is 12 hours and the total power-off time is 12 hours, the power-on time ratio is 50 %.
- ② refer to Tab. 10-5
- ③ The guaranteed value represents a battery life at 70 °C, which is calculated based on the characteristic values of manufacturer-supplied memories (SRAM) and on the assumption of storage within the ambient temperature range of -25 °C to 75 °C (operating ambient temperature of 0 °C to 55 °C).
- ④ The actual service value (reference value) represents a battery life that is calculated based on the values measured at storage ambient temperature of 40 °C. This value is intended for reference only, as it varies with characteristics of the memory.
- ⑤ In the following status, the backup time after power off is 3 minutes:
  - The battery connector is disconnected.
  - The lead wire of the battery is broken.

## SRAM card battery

### NOTES

- | Do not use the battery exceeding the guaranteed value of the battery life.
- | If the battery life for data buffering has expired the guaranteed time of the following table,
  - store program and data into a ROM, so that the data don't get lost, if the PLC is powered down or the battery voltage is low,
  - during the time given in the right column of the following table, save program and data on a PC, after special relay SM52 is set.
- | Note that the SRAM card battery is consumed even while the programmable controller is powered ON with the CPU module battery connected.
- | When the battery-low special relay SM52 turned on, immediately change the battery. Even if an alarm has not yet occurred, it is recommended to replace the battery periodically according to the operating condition.
- | The SRAM card is not available for the Basic model QCPU.

### ● Q2MEM-BAT

The life time of the battery Q2MEM-BAT depends on the used memory board and on the time, the CPU is switched ON. Additionally it depends on the serial number (version) of the CPU.

| SRAM card                | Power-on time ratio ① | Battery life                |                             |                      |

**Tab. 10-15: Battery life (Q3MEM-BAT)**

### 10.3.2 Replacement procedure of the CPU module battery

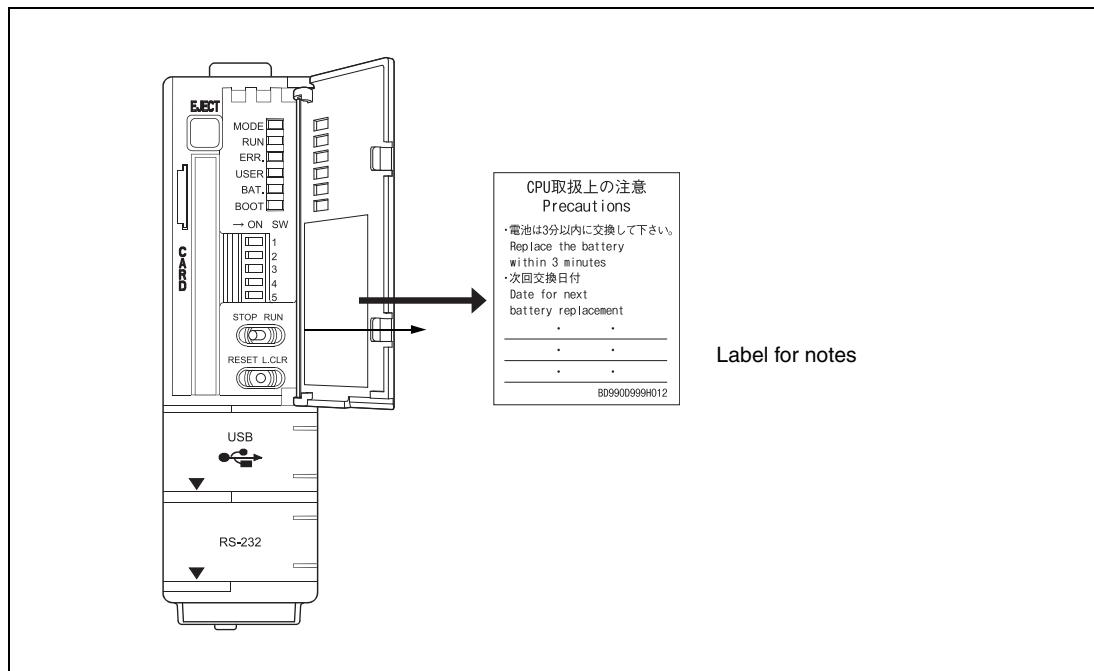

The battery of the CPU types Q00J, Q00 and Q01 are mounted on the front side of the module. All other CPU types have a case on the bottom side of the CPU (also refer to section 5.2.2).

The programmable controller power must be on for 10 minutes or longer before dismounting the battery, so that the capacitor is sufficiently charged for backing up the memory data during battery replacement.

#### NOTES

- Data in the memory are backed up for 3 minutes max. by a capacitor even after the battery is removed. The replacement of the battery should be done during this time.
- Back up the data in the CPU module by a PC before starting replacement.
- When replacing a battery of a Redundant CPU, back up the memory data such as programs by the memory copy from the control system to the standby system.
- Do a manual system switching by the programming software GX Developer or GX IEC Developer and replace the CPU battery of the former control system afterwards.
- For the memory copy from control system to standby system and system switching function, refer to the User's Manual of the Redundant System.

After replacing a battery, write the date for next battery replacement on the sticker on the back side of the front cover. Write the proper date by checking the battery life.

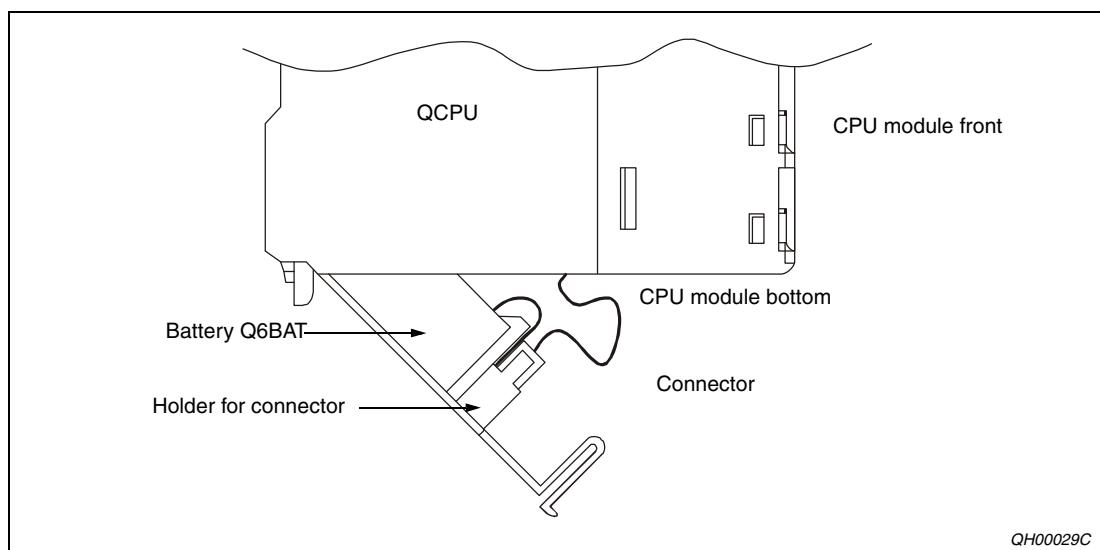

**Fig. 10-2:** Label for notes of the date for next battery replacement on the back side of the front cover

**Replacement procedure of the Q6BAT battery**

- ① Turn off the programmable controller power supply.
- ② Remove the CPU module from the base unit.
- ③ Open the battery cover of the CPU
- ④ Disconnect the battery connector.
- ⑤ Remove the old battery from its holder.
- ⑥ Insert a new battery into the holder in the correct direction.
- ⑦ Connect the lead to the connector.
- ⑧ Insert the battery holder into the CPU module (not for Q00JCPU, Q00CPU and Q01CPU).
- ⑨ Install the CPU module into the base unit.
- ⑩ Turn on the programmable controller power supply.
- ⑪ Monitor SM51 to verify on/off.

If the special relay is still set, indicating with SD52 a low CPU battery voltage, retry the replacement. Check the battery voltage. If it is too low for the memory card, the battery must be replaced (refer to section 10.3.3).

**Fig. 10-3: Location of battery Q6BAT**

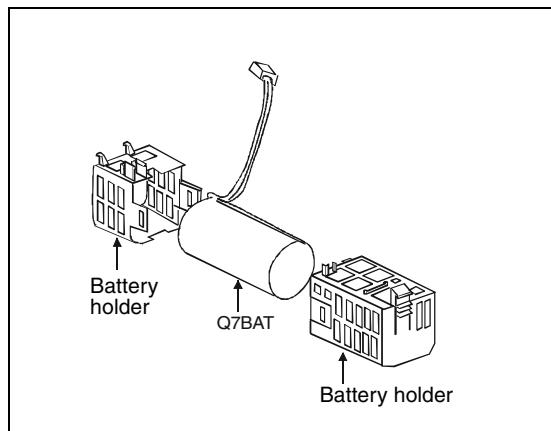

### Replacement procedure of the Q7BAT battery or replacement of a Q6BAT by Q7BAT

**NOTE**

Battery Q7BAT is not available in EU countries.

- ① Turn off the programmable controller power supply.
- ② Remove the CPU module from the base unit.
- ③ If the battery Q6BAT is used, open the battery case of the CPU. When a battery Q7BAT is installed, remove the battery holder at the bottom of the CPU module.
- ④ Disconnect the battery connector.
- ⑤ If the Q6BAT should be replaced by Q7BAT, remove the battery Q6BAT and the cover of the battery case.

When a Q7BAT is to be replaced by a Q7BAT, disengage the catch on one side of the battery holder to disassemble the holder into two, and remove the old battery. Insert the new Q7BAT into the holder in the correct direction, and reassemble the battery holder so that the battery cable comes out of the hole in the holder connection.

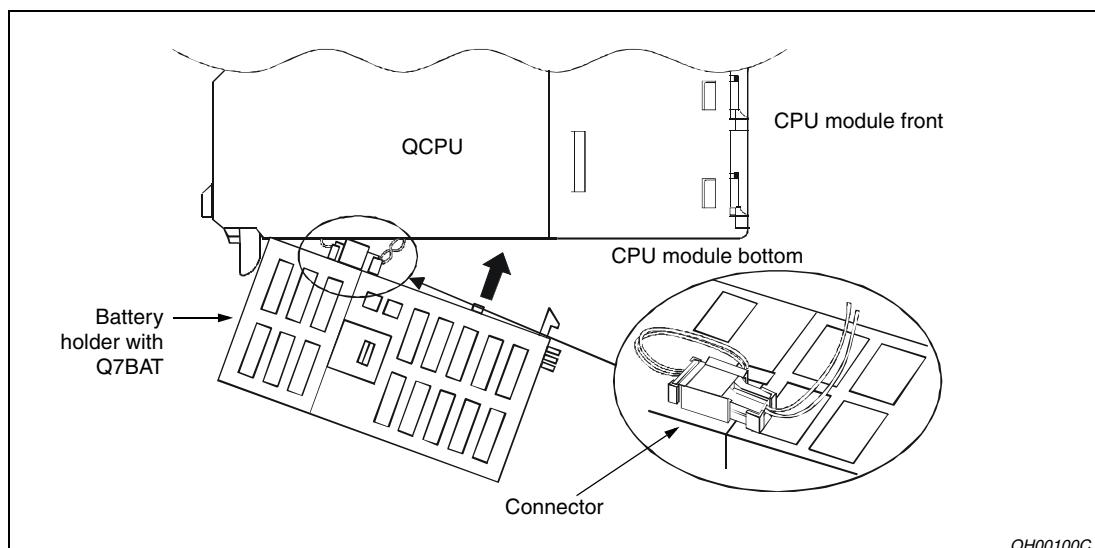

**Fig. 10-4:**

Disengage the catch on one side of the battery holder to disassemble the holder into two.

QH00101c\_UK

- ⑥ Connect the Q7BAT to the battery connector of the CPU module, and set it into the connector holder of the battery holder.
- ⑦ Set the battery holder to the CPU module.

QH00100C

**Fig. 10-5: Location of battery Q7BAT at the bottom of the CPU module**

- ⑧ Install the CPU module into the base unit.
- ⑨ Turn on the programmable controller power supply.
- ⑩ Monitor SM51 to verify on/off.

If the special relay is still set, indicating with SD52 a low CPU battery voltage, retry the replacement. Check the battery voltage. If it is too low for the memory card, the battery must be replaced (refer to next section 10.3.3).

### 10.3.3 SRAM card CPU module battery replacement procedure

#### NOTES

Before replacing battery back up the SRAM card data using a programming device.

The battery replacement at the CPU must be done with power supply ON. Observe all safety precaution when working with power supply switched on:

When replacing the battery with the programmable controller power supply off, proceed as follows:

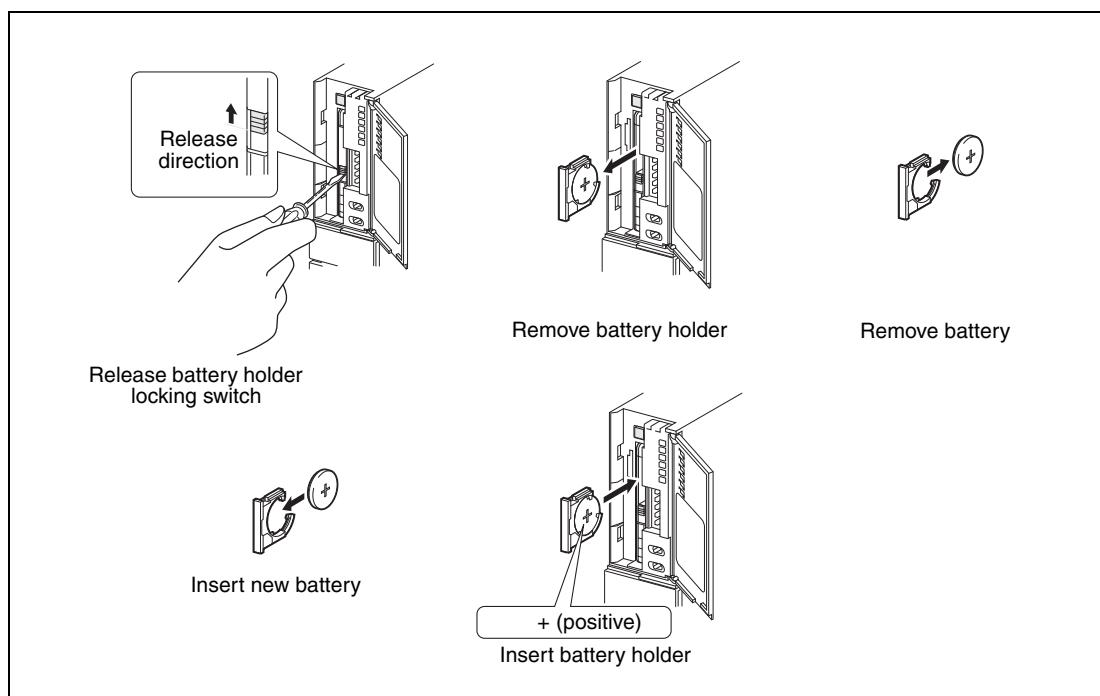

- Back up the SRAM card data using a programming device.
- Remove the memory card and replace the battery.
- Insert the memory card into the CPU.
- Write the backed up data from the programming device to the memory card.

When dismounting or mounting the battery holder on the SRAM card, take care so that the battery does not come out of the battery holder.

#### Replacement procedure of SRAM card battery Q2MEM-1MBS and Q2MEM-2MBS

- ① Open the front cover while the programmable controller power supply is on.
- ② With a flat-blade screwdriver, etc., remove the battery holder locking switch from the LOCK position (also refer to section 5.2.3).
- ③ Remove the battery holder from the SRAM card.
- ④ Remove the old battery from its holder.
- ⑤ Insert a new battery into the holder in the correct direction.
- ⑥ Insert the battery holder to the memory card and check that the battery holder fixing switch is set to the LOCK position.
- ⑦ Monitor SM52 to verify on/off. If the special relay is still set, indicating with SD52 a low CPU battery voltage, retry the replacement.

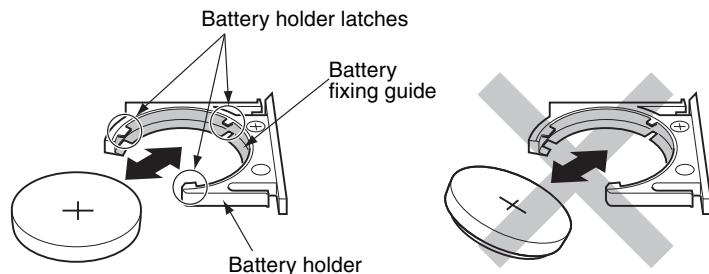

The following figure shows some of the steps for replacing the battery.

**Fig. 10-6: Replacing SRAM card batteries Q2MEM-1MBS and Q2MEM-2MBS**

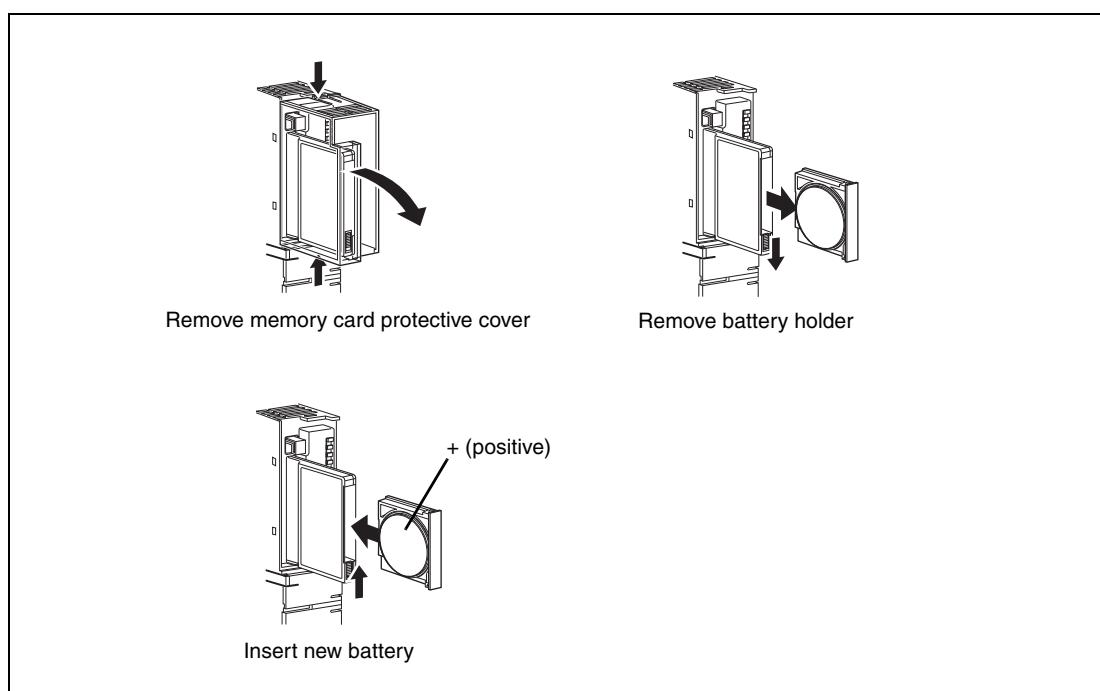

**NOTE**

Insert or remove the battery in the horizontal direction along the battery holder fixing guide. Failure to do so may damage the latches of the battery holder.

**Replacement procedure of SRAM card battery Q3MEM-4MBS and Q3MEM-8MBS**

- ① Remove a memory card protective cover of the CPU module at power-on status of the programmable controller (refer to section 5.1.3).
- ② With a flat-blade screwdriver, etc., remove the battery holder locking switch from the LOCK position (also refer to section 5.2.3).
- ③ Remove the battery holder from the SRAM card.
- ④ Remove the old battery from its holder.
- ⑤ Insert a new battery into the holder in the correct direction.
- ⑥ Insert the battery holder into the SRAM card.
- ⑦ Set the battery holder fixing switch to the LOCK position.
- ⑧ Set the memory card protective cover on the CPU module.
- ⑨ Monitor SM52 to verify on/off. If the special relay is still set, indicating with SD52 a low CPU battery voltage, retry the replacement.

The following figure shows some of the steps for replacing the buffer battery,

**Fig. 10-7: Replacing SRAM card batteries Q3MEM-4MBS and Q3MEM-8MBS**

## 10.4 Resuming operation of CPU after storage

The content of the memory is kept by the battery, even if the CPU or memory card is stored or if the power supply of the PLC hasn't been switched on over a long time. Refer to section 10.3.1 for the life time of the batteries. (The power-on time ratio is 0 %, when the power supply is switched off or during storage.)

Data may be lost,

- if the CPU or memory card is stored without battery.
- if a battery is installed, but the battery voltage falls under the minimum value during storage.

### Buffer battery of the CPU

If the CPU battery is missing or discharged, format the following memory areas by the programming software GX Developer or GX IEC Developer, before operating the CPU:

- Program memory
- Standard RAM.

To format a program memory during boot operation, select the "Clear program memory" checkbox in the **Boot file** tab of the PLC parameter dialog box.

### Buffer battery of the SRAM memory card

If the SRAM memory card battery is missing or discharged, format the memory card, before operating the CPU too.

#### NOTES

- Data in the CPU standard ROM and in Flash and ATA memory cards don't need battery buffering. The data will not be lost even after demounting or at battery failure.
- When using the function of storing latch data into the standard ROM with the universal model CPU PLC, these data will not be lost even after demounting or at battery failure.
- Save all data from the CPU and from the memory card by the programming software GX Developer or GX IEC Developer, before storage or shutting off the power supply of the PLC.
- When the programmable controller is powered on or the CPU module is reset, the CPU module initializes all of the following data if an error is detected:
  - Program memory data
  - Standard RAM data
  - Error history
  - Latch data (latch relay (L), devices in latch setting range set in the parameter, special relay SM900 to SM999, special register SD900 to SD900)
  - Sampling trace data

# 11 Troubleshooting

This chapter describes errors that may occur during system operation, how to locate the errors, and measures against the errors.

## 11.1 Troubleshooting basics

In order to increase the reliability of the system, resuming the system operation promptly after correcting a problem is one of the important factors as well as using reliable device. To promptly start up the system, the trouble cause must be located and eliminated correctly.

The basic three points to be followed in the troubleshooting are as follows:

### Visual inspection

- Behavior of the programmable controller and other connected devices (in STOP mode or in operation)
- Applicability of the power supply
- States of input and output devices
- Installation states of the power supply module, CPU module, I/O module, intelligent function module, and extension cables
- Wiring (Cables including input and output cables)
- Display status of all indicators such as "POWER", "RUN", "ERR.", and "I/O" LEDs
- Setting status of all switches such as the number of extension base units and data retention time during power failure

After checking above points, connect a programming device and monitor the operating status and programs of the programmable controller.

### Error checking

Check how the error status changes by operating the following to the programmable controller.

- Set the mode switch to STOP.
- Clear the Latch area with the L.CLR switch or with the programming device.
- Power on and off.\*

\* Resetting and powering off clears the error codes stored in the completion status area for the dedicated instruction and the buffer memory states of intelligent function modules. Before resetting or powering off, backup the error codes and buffer memory states that are relevant to the error.

### Narrowing down the scope for identifying trouble cause

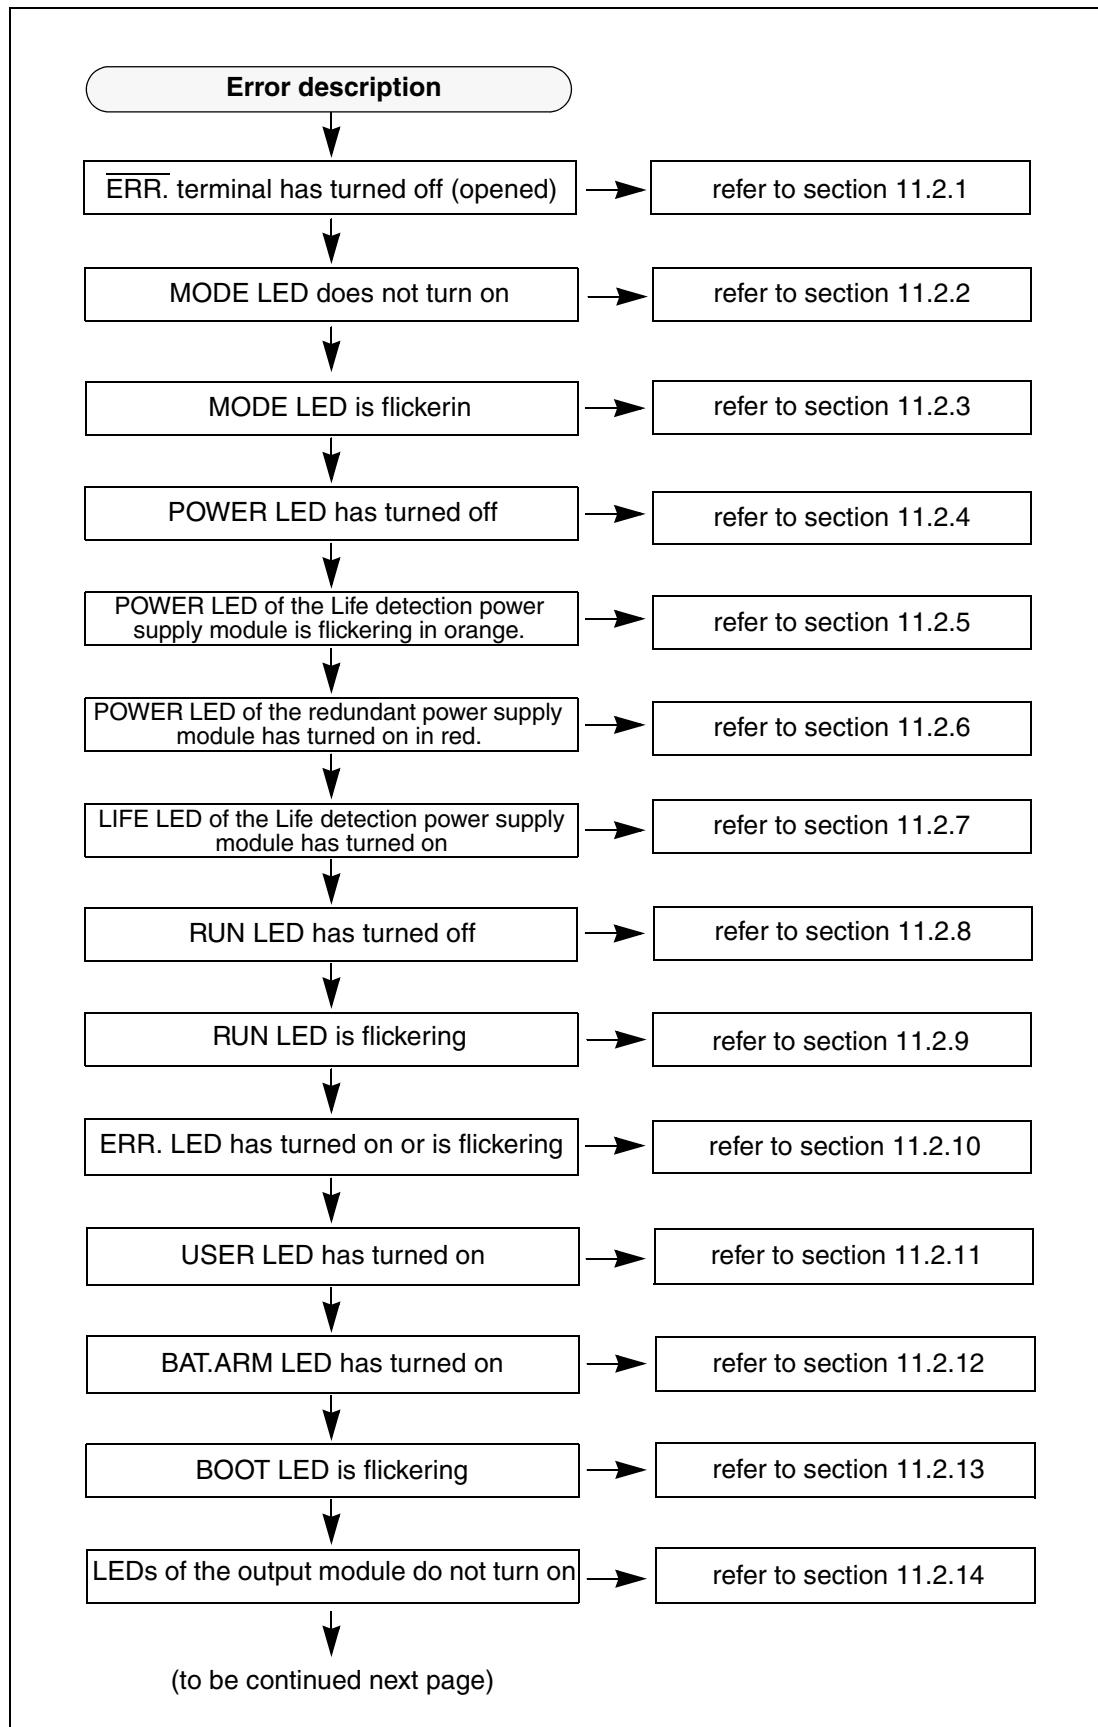

Estimate the troubled part in accordance with above items (visual inspection, error checking). Trouble causes could occur in:

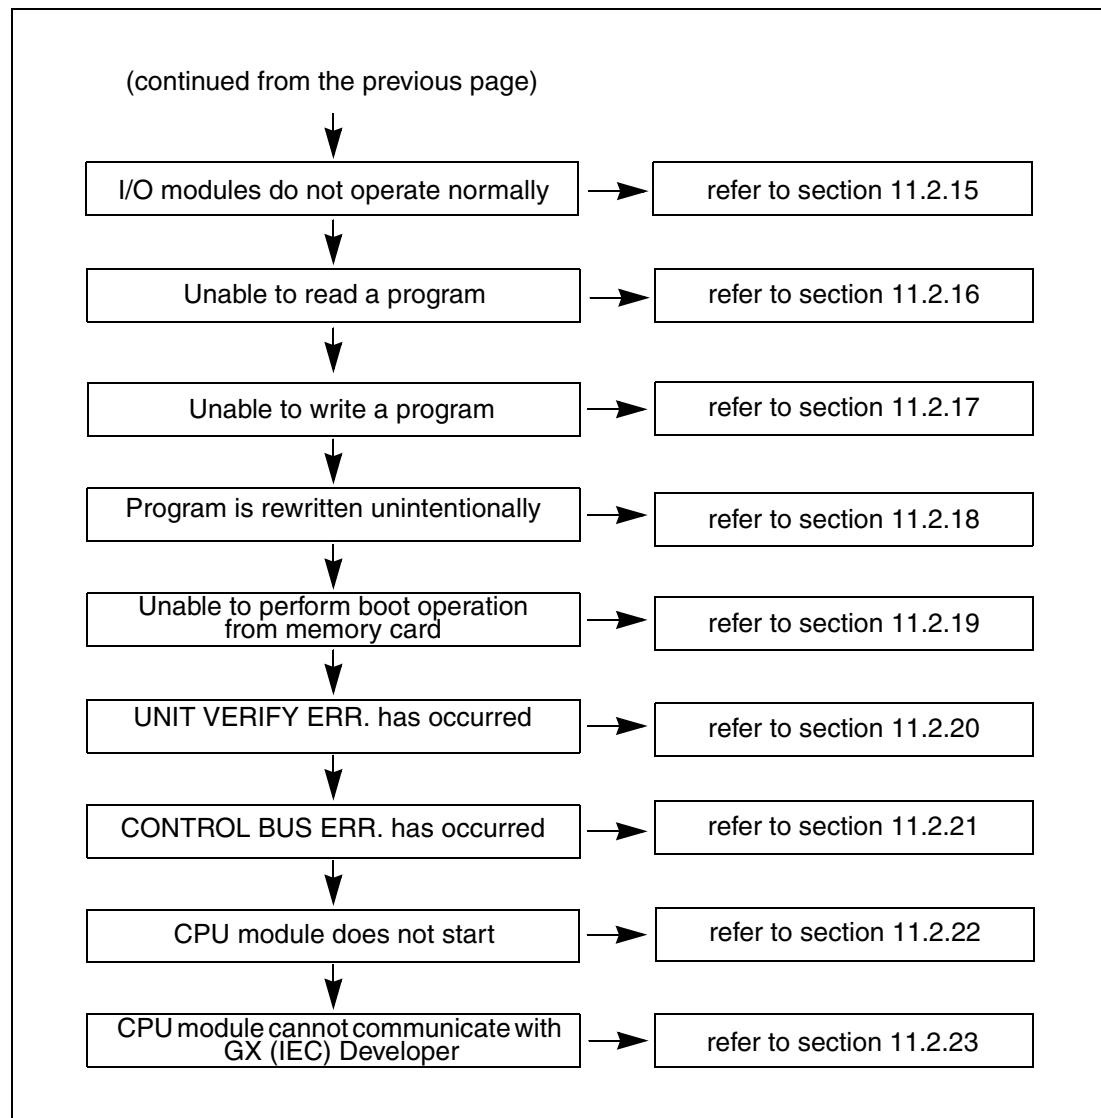

- Programmable controller or external devices
- I/O module or others
- Sequence program

The troubleshooting flowcharts on following pages provide more help for identifying trouble causes.

## 11.2 Troubleshooting

**Troubleshooting flowchart**

### 11.2.1 **ERR. terminal (negative logic) has turned off (opened)**

The ERR. contact (error output) of the power supplies is closed in normal operation (refer to sections 7.3 and 7.4).

- If the ERR. terminal has turned off (opened), check first: How is the ERR. LED of the CPU module? If the ERR. LED is flickering (CPU module is in stop error), check error details and take action according to the details (refer to section 11.2.10).
- If the ERR. LED of the CPU is not flickering, check the following:  
Is power supplied? Is the power supply voltage proper?  
If not, supply power of proper voltage.
- If the power supply voltage is proper, check the MODE LED of the CPU\*. If it's on (green), the corresponding power supply module is faulty (replace it with a normal power supply module).  
\* Q00J-, Q00- or Q01CPU do not have a MODE LED. In this case continue troubleshooting with the next point.
- If the MODE LED is off, remove the corresponding power supply module, and mount it to the normal base unit. (Do not mount any modules other than the power supply module.)  
If the POWER LED of the power supply module is on (red), the corresponding power supply module is faulty (replace it with a normal power supply module).
- If the POWER LED of the power supply module turned on (green), mount the corresponding power supply module to the original system again, and remove all modules other than the power supply module from the base unit.  
If the POWER LED of the power supply module is off, the base unit that includes the corresponding power supply module is faulty and must be replaced.
- If the POWER LED of the power supply module is on (green), (when mounted to the original system again), check the sum of internal current consumptions of the modules that comprise the system.
  - If the total current exceeds the rated current consumption of one power supply module, Reexamine the system configuration to make the total current less than the rated current consumption of one power supply module.
  - If the total current does not exceed the rated current consumption of one power supply module, a hardware fault may have occurred in one of the modules. Execute operation checks in due order, starting with the minimum system. For the module that does not operate, please contact your local Mitsubishi service center or representative, explaining a detailed description of the problem.

**NOTE**

If a CPU module stop error occurs during use of two redundant power supply modules, the error is output from the ERR. terminals of the two redundant power supply modules. (Both ERR. terminals are opened.)

### Errors that can be detected by the ERR. terminal

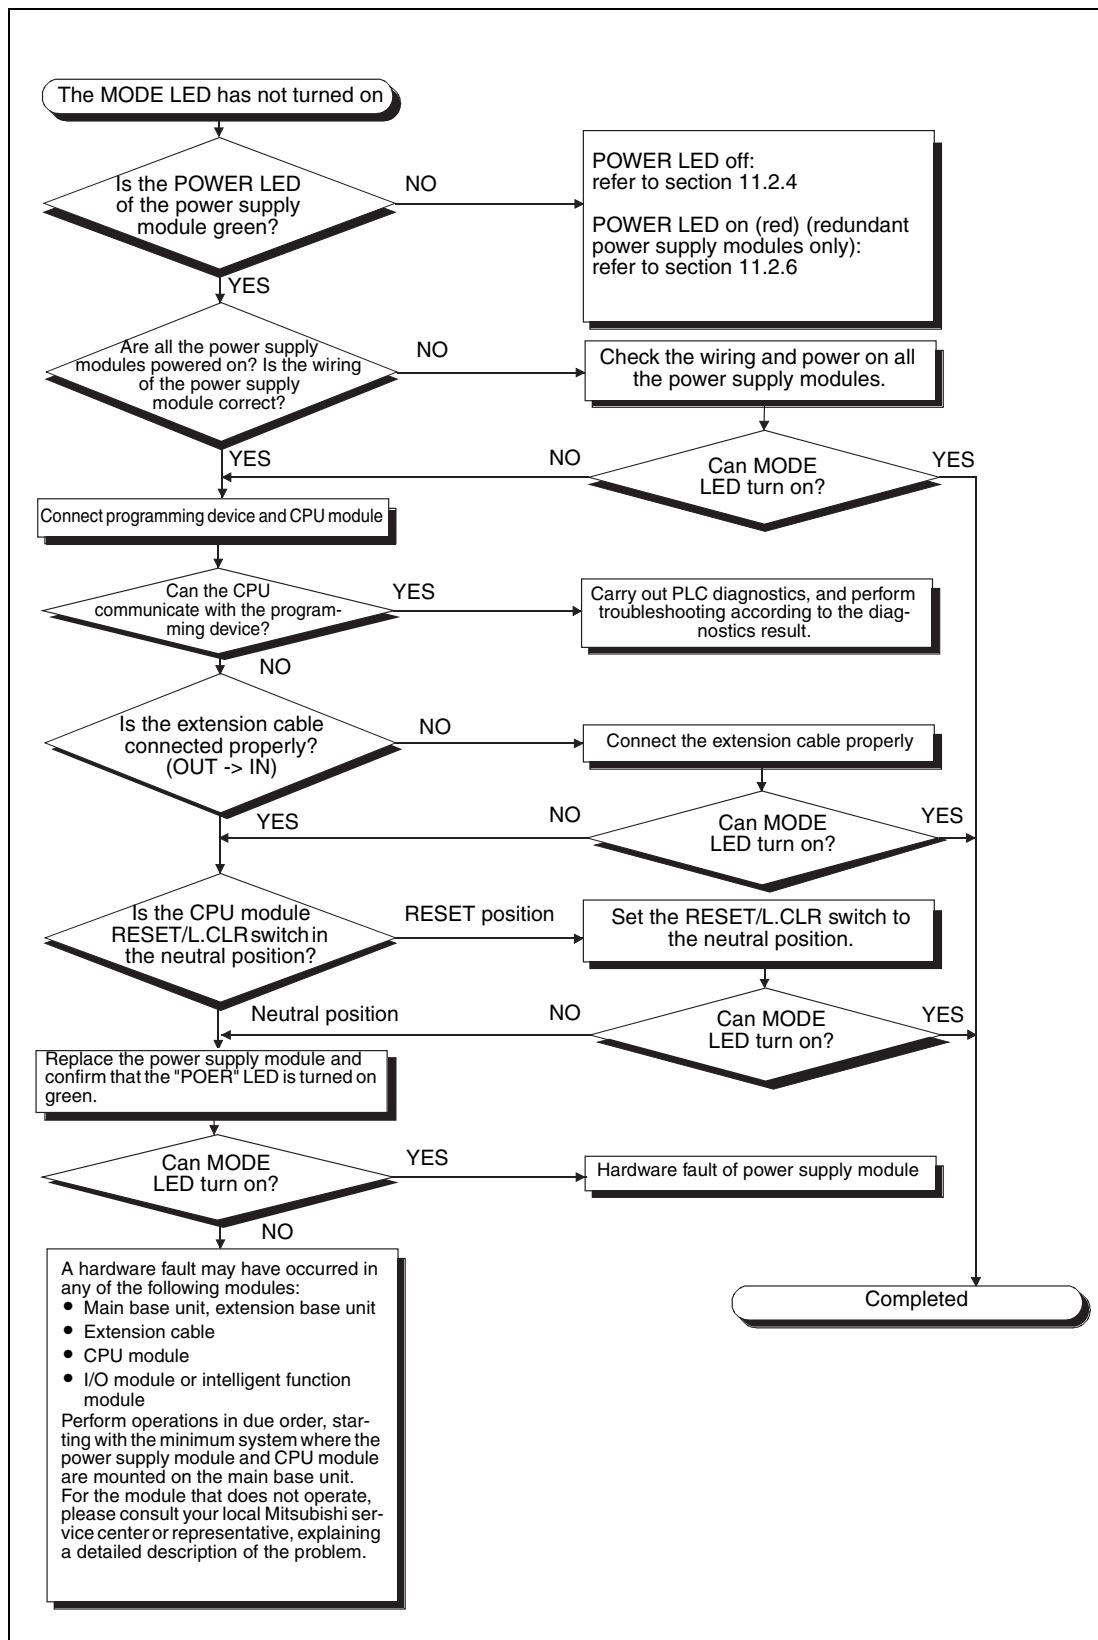

| Power supply module used on |  | Detected errors   |                      |                   |
|-----------------------------|--|---|----------------------|-------------------|
|                             |  | Basic model QCPU *<br>High performance model QCPU<br>Universal model QCPU*  | Process CPU          | Redundant CPU     |
| Main base unit              | Q33B<br>Q35B<br>Q38B<br>Q312B<br>Q38DB<br>Q312DB | <ul style="list-style-type: none"> <li>• AC power not input</li> <li>• Power supply module fuse blown</li> <li>• CPU module stop error</li> <li>• CPU RESET</li> </ul>  |                      |                   |
|                             | Q32SB<br>Q33SB<br>Q35SB                          | <ul style="list-style-type: none"> <li>• AC power not input</li> <li>• Power supply module fuse blown</li> <li>• CPU module stop error</li> <li>• CPU RESET</li> </ul>  | (Cannot be combined) |                   |
|                             | Q38RB  | <ul style="list-style-type: none"> <li>• Power supply module failure</li> <li>• AC power not input</li> <li>• Power supply module fuse blown</li> <li>• CPU module stop error</li> <li>• CPU RESET</li> </ul> |                      |                   |
| Extension base unit         | Q63B<br>Q65B<br>Q68B<br>Q612B                    | Errors cannot be detected (always off)  |                      | (Cannot be added) |
|                             | Q68RB<br>(two power supply modules used)         | <ul style="list-style-type: none"> <li>• Power supply module failure</li> <li>• AC power not input</li> <li>• Power supply module fuse blown</li> </ul>   |                      |                   |

**Tab. 11-1:** Errors that can be detected by the ERR. terminal

\* Excluding the Q00JCPU and Q00UJCPU (without ERR. terminal)

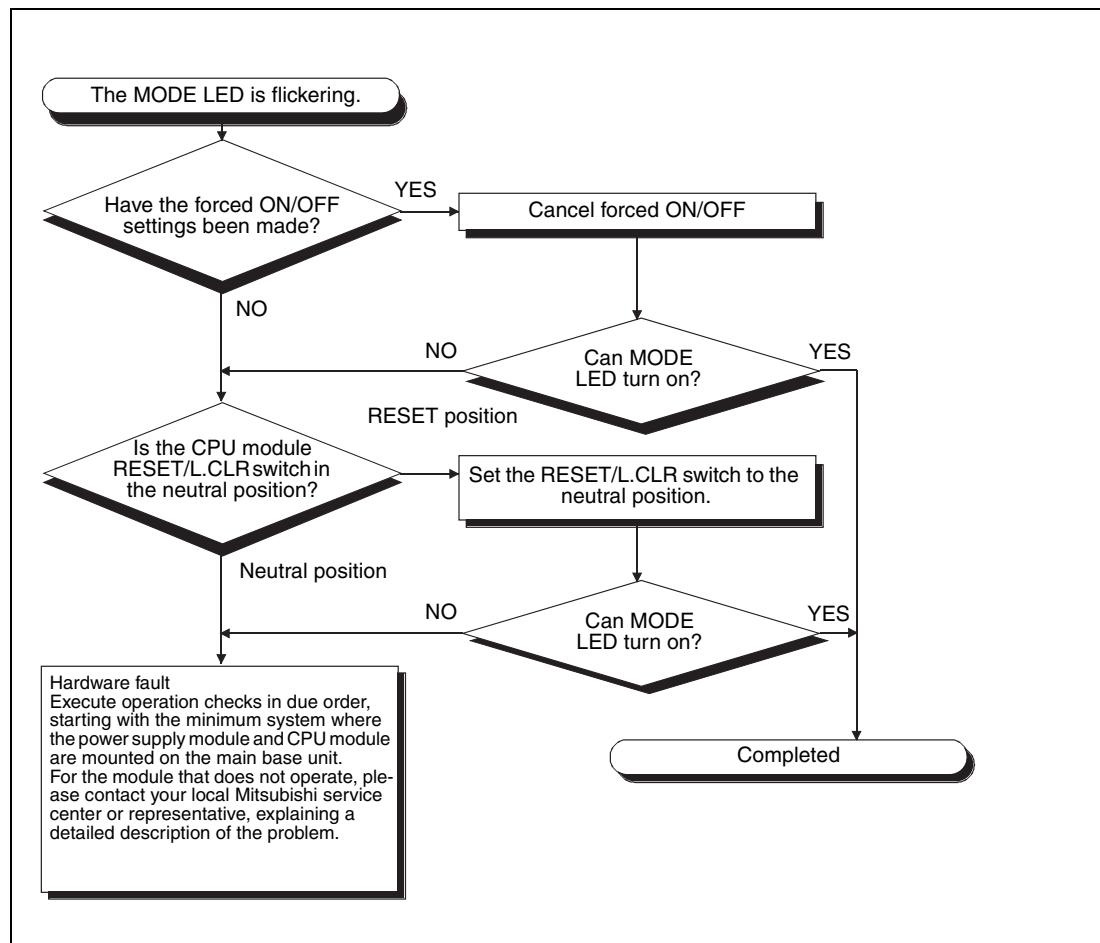

### 11.2.2 The MODE LED does not turn on

Refer to the following flowchart when the MODE LED of the CPU module does not turn on at programmable controller power-on.

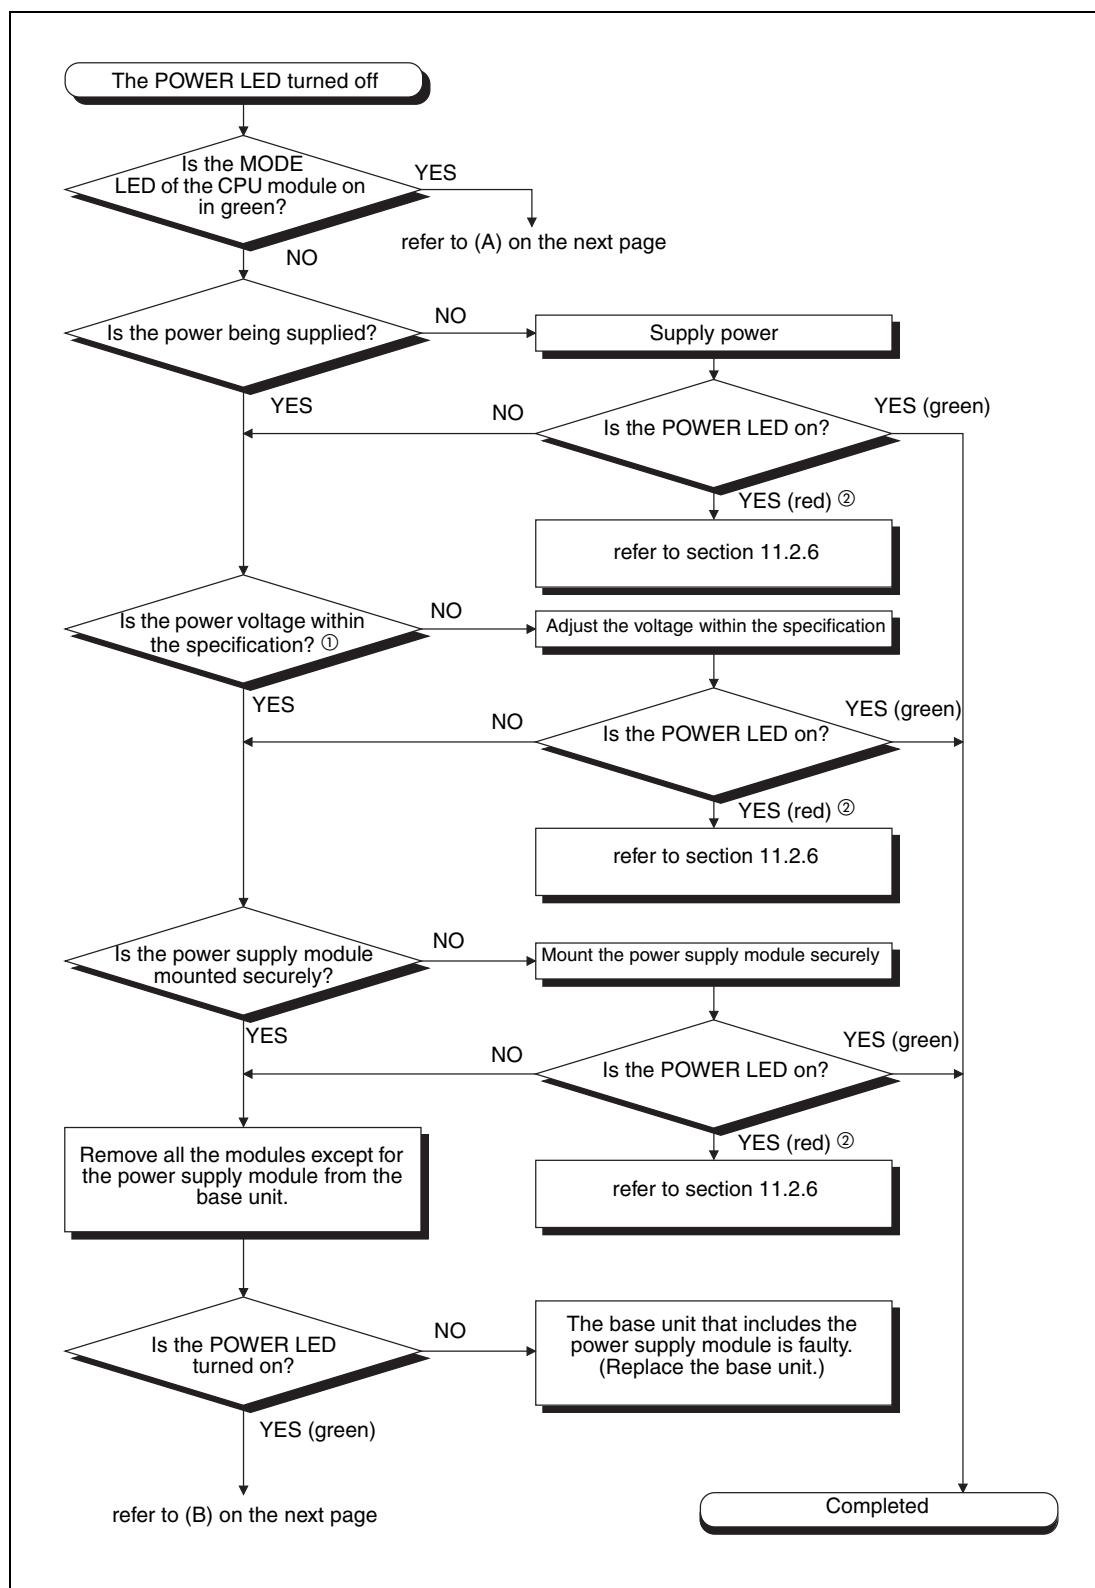

### 11.2.3 When the MODE LED is flickering

Refer to the following flowchart when the MODE LED of the CPU module flickers at programmable controller poweron, at operation start or during operation.

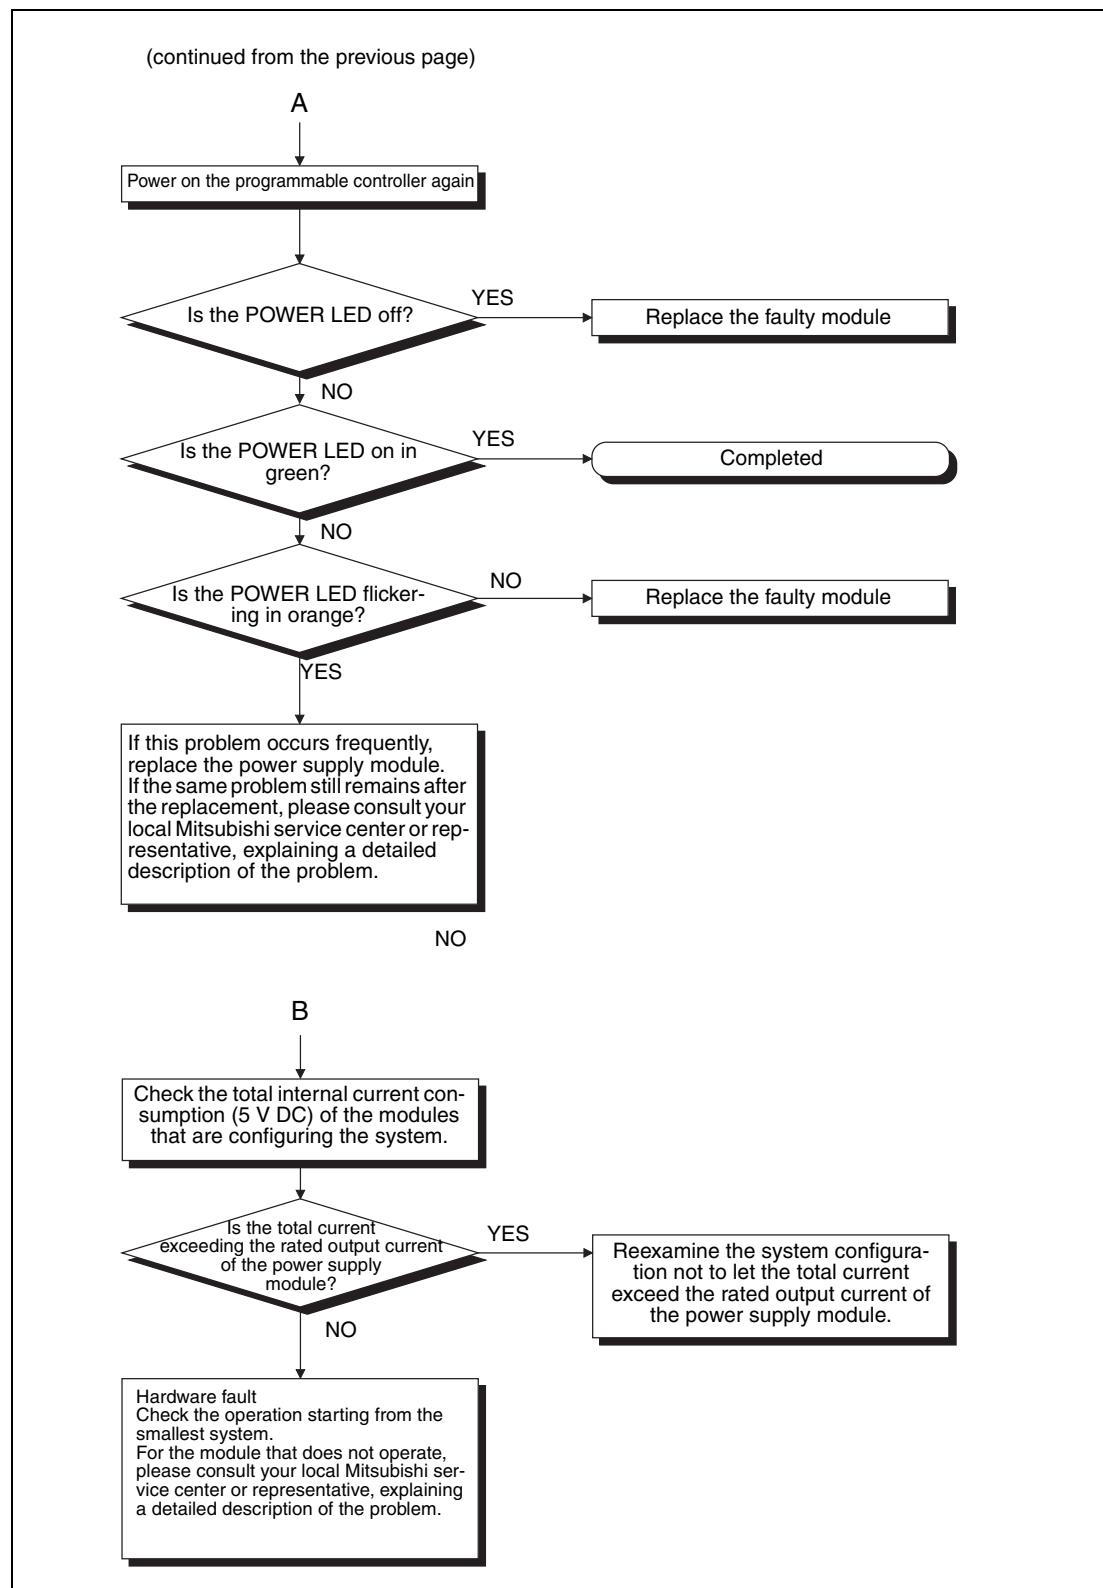

### 11.2.4 When the POWER LED has turned off

① Specified voltage range:  
Rated input voltage 100–120 V AC: 85 to 132 V AC,  
Rated input voltage 200–240 V AC: 170 to 264 V AC,  
Rated input voltage 24 V DC: 15.6 to 31.2 V DC

② Applicable only to the redundant power supply module

### 11.2.5 When the POWER LED is flickering in orange

When the POWER LED of the Life detection power supply module Q61P-D flickers in orange at power-on or during operation of the programmable controller, power on the programmable controller again.

- If the POWER LED is flickering again, the corresponding power supply module is faulty and must be replaced.
- If the POWER LED is on in green after powering on, there is no error.
- If the POWER LED is off after powering on, refer to the flowchart for when the POWER LED turned off in section 11.2.4.

### 11.2.6 When the POWER LED has turned on in red

- When the POWER LED of the redundant power supply module has turned on in red at power-on or during operation of the programmable controller, remove the corresponding redundant power supply module, and mount it onto the normal redundant base unit. (At this time, do not mount any modules other than the redundant power supply module.)

If the POWER LED of the redundant power supply module is off or on in red, the corresponding redundant power supply module is faulty. (Replace it with a normal one.)

- If the POWER LED of the redundant power supply module is on in green, return the corresponding redundant power supply module to the original system, and remove all modules other than the redundant power supply module from the redundant base unit.

If the POWER LED of the redundant power supply module is off, the redundant base unit that includes the corresponding redundant power supply module is faulty. (Replace it with a normal redundant base unit.)

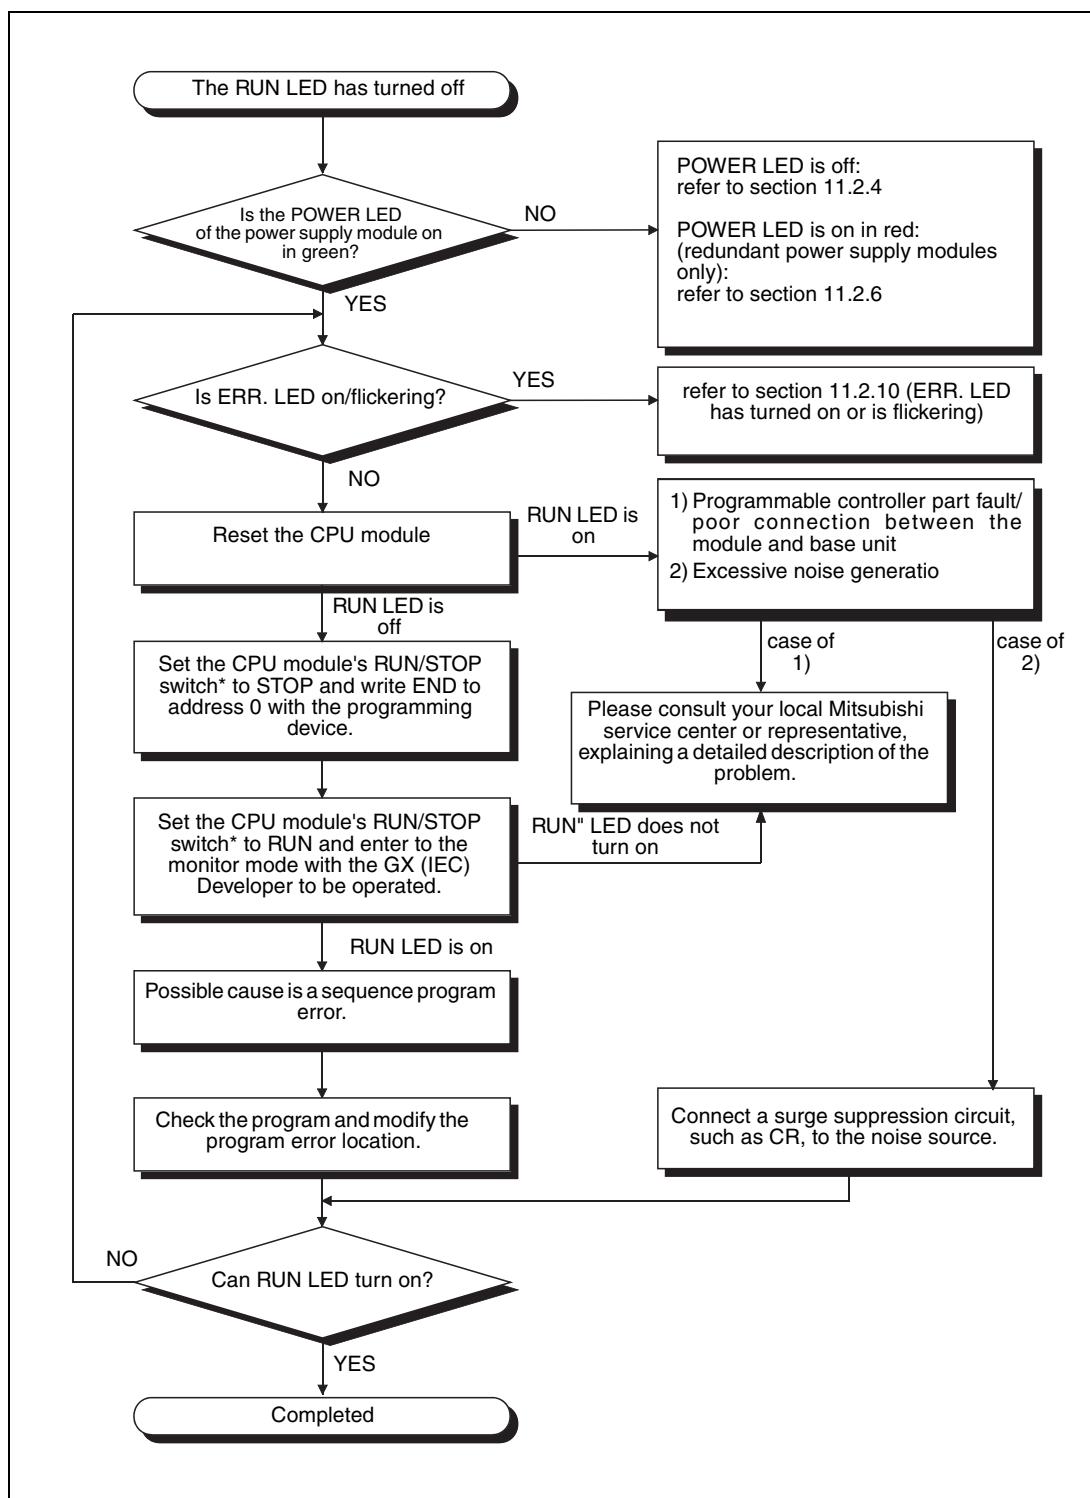

- If the POWER LED of the redundant power supply module is on in green (when returned to the original system), check the sum of internal current consumptions of the modules that comprise the system.

- If the total current exceeds the rated output current of the power supply module, reexamine the system configuration to make the total current less than the rated current consumption of one redundant power supply module.
  - If the total current does not exceed the rated output current of the power supply module, a hardware fault may have occurred in one of the modules. Execute operation checks in due order, starting with the minimum system. For the module that does not operate, please consult your local Mitsubishi service center or representative, explaining a detailed description of the problem.

### 11.2.7 When the LIFE LED has turned off or turned on in red/is flickering in red

When the LIFE LED of the Life detection power supply module Q61P-D turned off or turned on in red/is flickering in red at power-on or during operation of the programmable controller, refer to section 7.2.3 for possible causes.

### **11.2.8 When the RUN LED has turned off**

\* For the Basic model QCPU, use the RUN/STOP/RESET switch for operation.

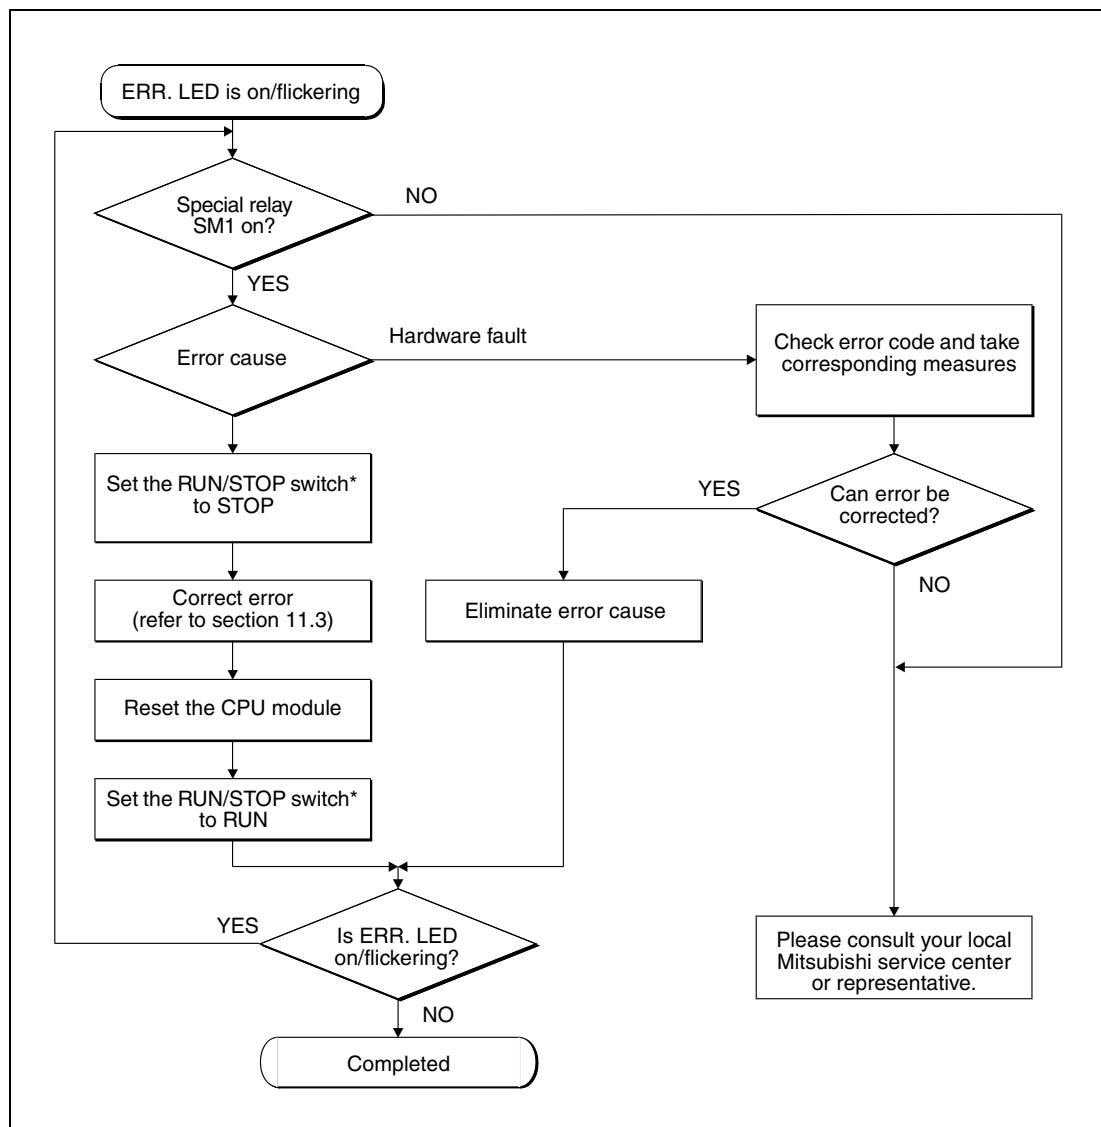

### 11.2.9 When the RUN LED is flickering

When the programs or parameters are written into the CPU module during the STOP status and then the RUN/STOP switch\* is set from STOP to RUN, the RUN LED of the CPU module flickers. Although this status does not mean the CPU module error, the CPU module stops the operation.

Reset the CPU after changing the program or parameters in STOP mode. Afterwards select the RUN mode by setting the RUN/STOP switch\* to RUN.

If the CPU should restart without reset, after changing the program or parameters in STOP mode, set the RUN/STOP switch\* from STOP to RUN, afterwards to STOP and then again to RUN.

### 11.2.10 When the ERR. LED has turned on or is flickering

\* For the Basic model QCPU, use the RUN/STOP/RESET switch for operation.

### 11.2.11 When the USER LED has turned on

The USER LED turns on when an error is detected by the CHK instruction or the annunciator (F) turns on. Monitor the corresponding special relays in the monitor mode of a programming device (CHK instruction = SM80, SD80; annunciator F = SM62, SD62 to SD79).

The USER LED can be turned off by:

- Resetting with the RESET/L.CLR switch or
- Executing the LEDR instruction in the sequence program.

**NOTE**

When the RESET/L.CLR switch is tilted to L.CLR several times for latch clear operation, the USER LED flickers to indicate that the latch clear processing is in process. When the RESET/L.CLR switch is further tilted to L.CLR while the USER LED flickering, the USER LED turns off and terminates the latch clear processing.

### 11.2.12 When the BAT.ARM LED has turned on

The BAT.ARM LED turns on when a low battery capacity (CPU module battery or SRAM card battery) is detected.

Monitor the special relays and special registers (SM51, SM52, SD51 and SD52) in the monitor mode of a programming device.

After checking, replace the battery with a new one, and reset the CPU module or run the LEDR instruction, and the BAT.ARM LED will turn off.

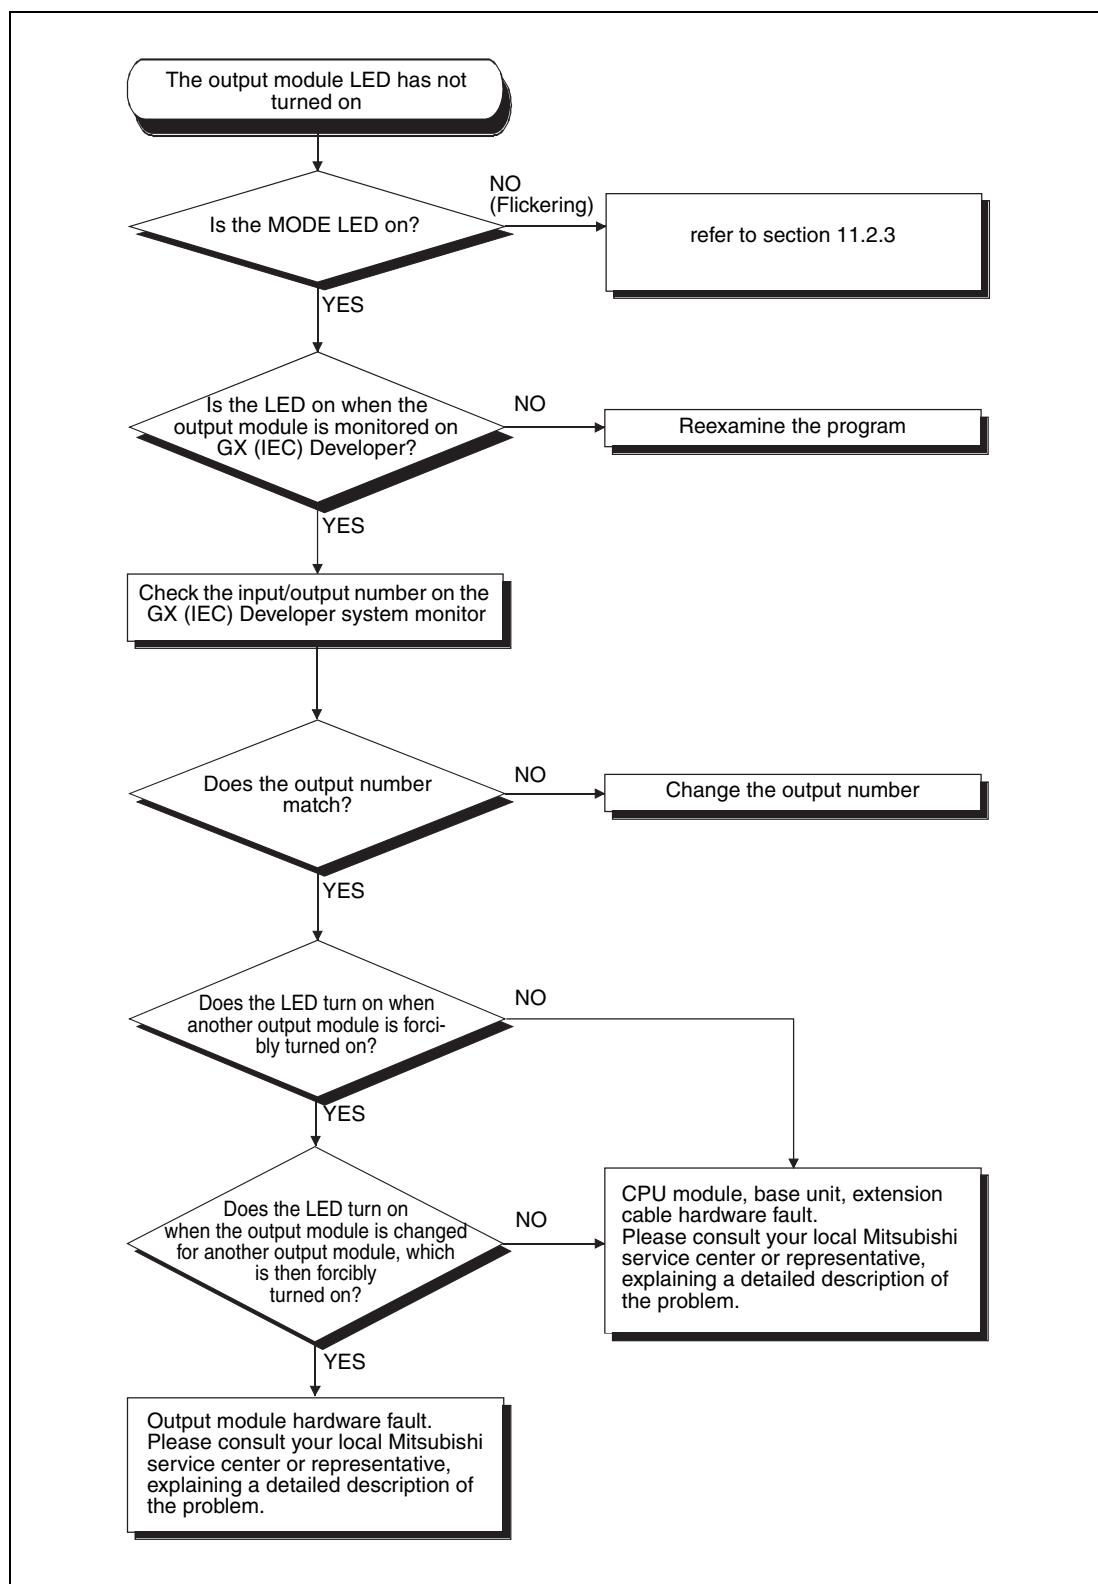

### 11.2.13 When the BOOT LED is flickering

- When the BOOT LED of the CPU module flickers at programmable controller power-on, at operation start, or during operation, power off the programmable controller.
- Remove the memory card.
- Move the DIP switches SW2 and SW3 of the CPU module to ON (refer to section 4.4.2).
- Power on the programmable controller.

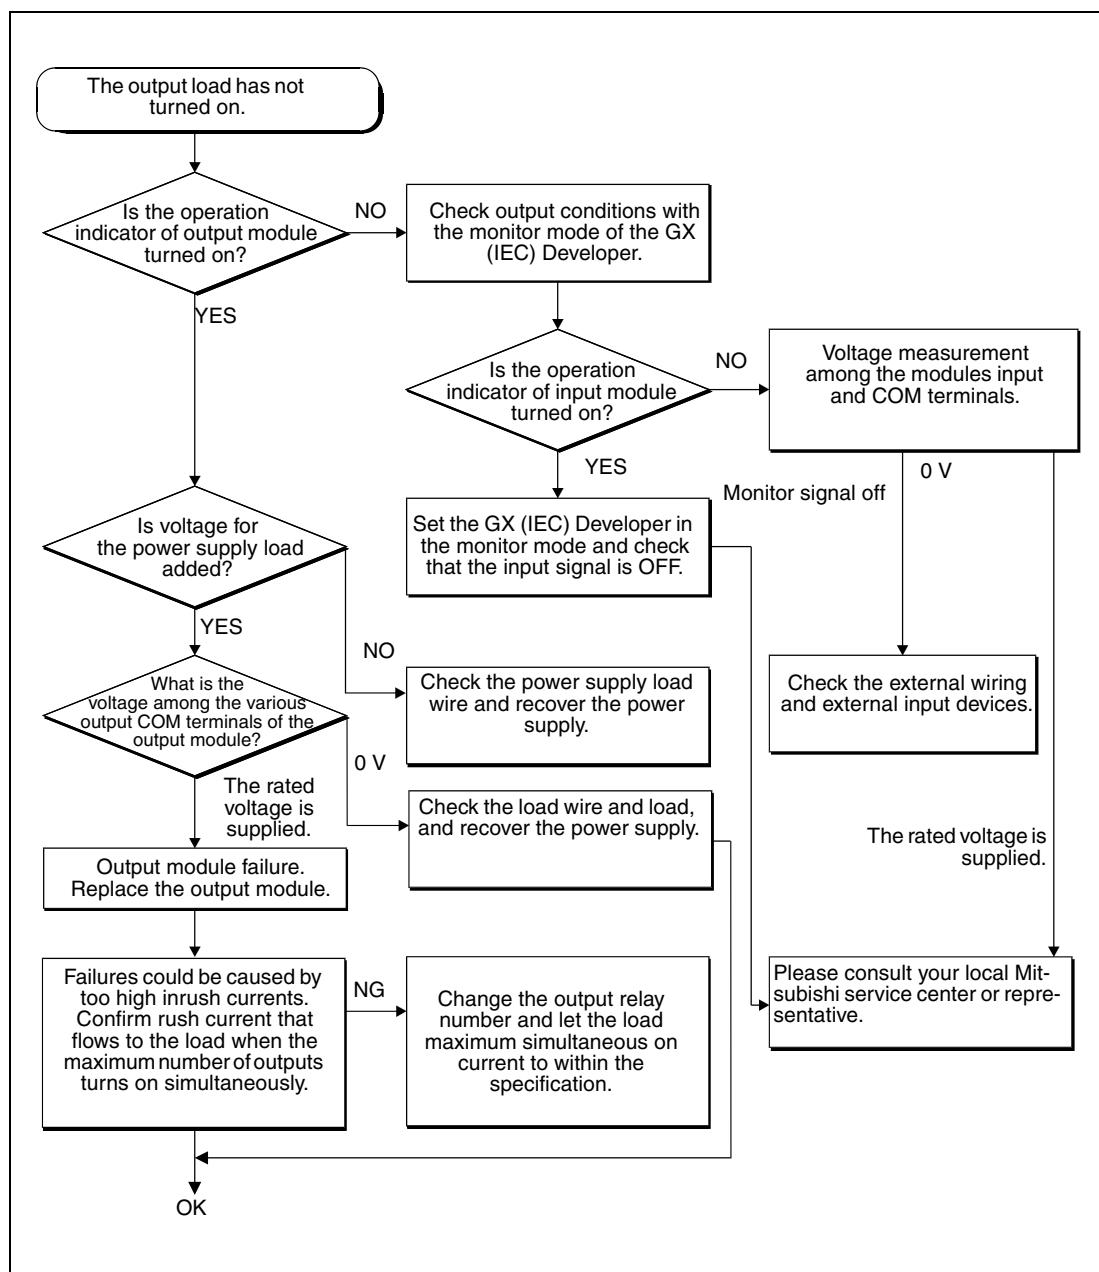

If the BOOT LED turns on, the automatic write from memory card to standard ROM is completed. Perform boot operation from standard ROM.

If the BOOT LED does not turn on, a hardware fault may have occurred in the CPU module. Please consult your local Mitsubishi service center or representative, explaining a detailed description of the problem.

### 11.2.14 When the LEDs of the output module do not turn on

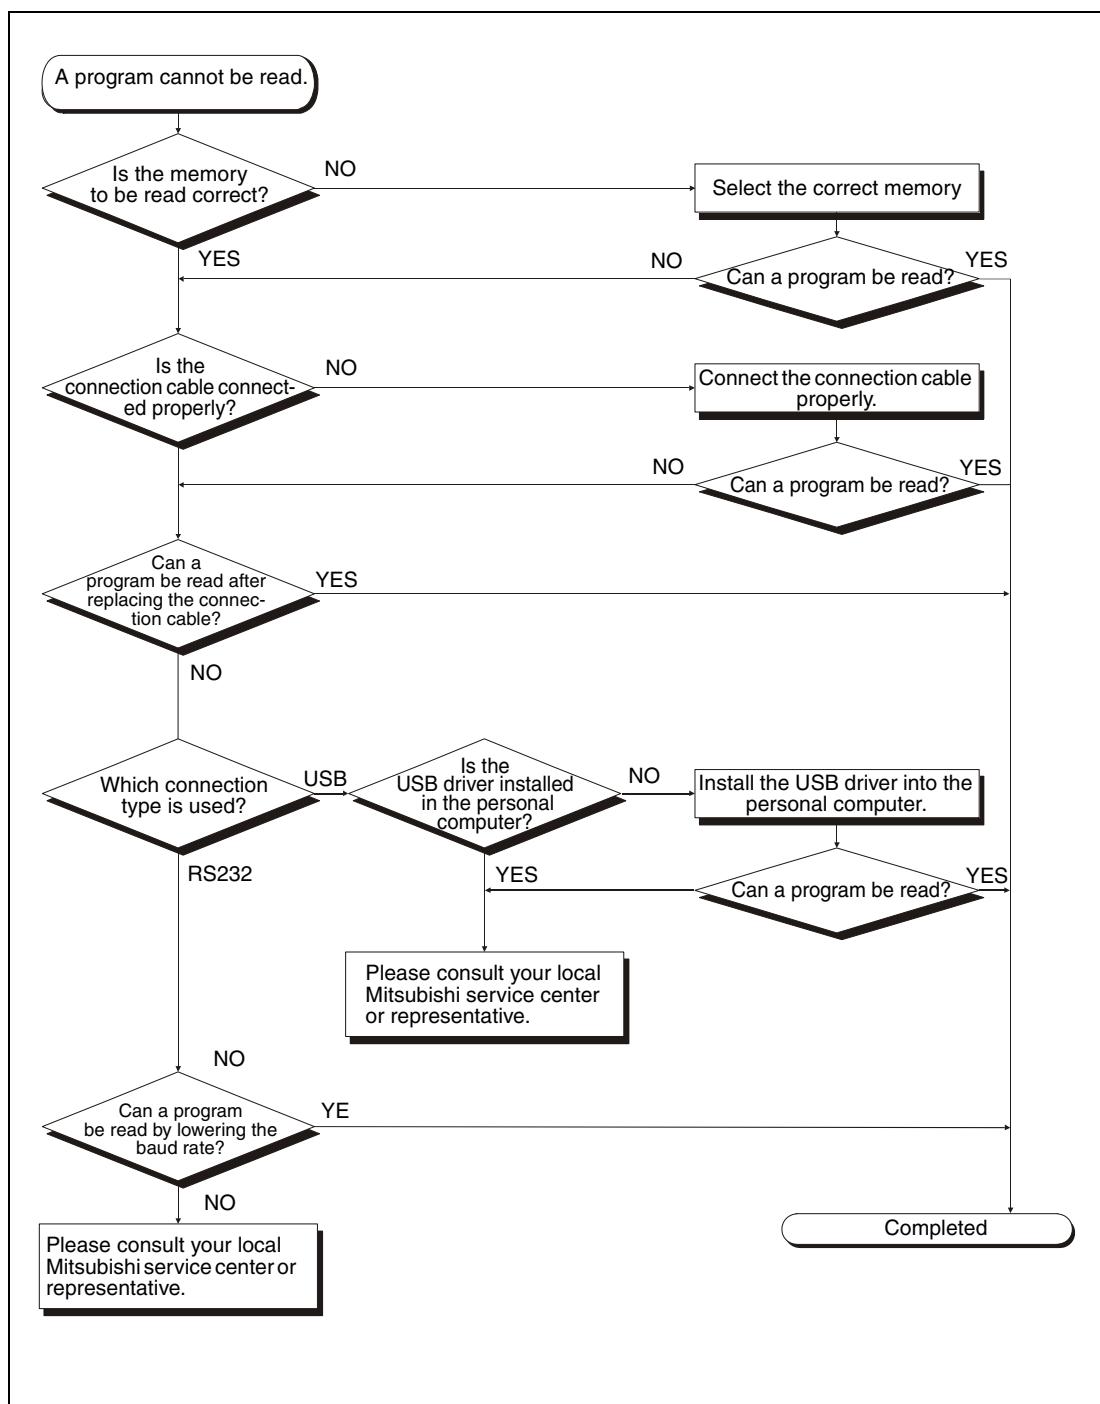

### 11.2.15 When output load of the output module does not turn on

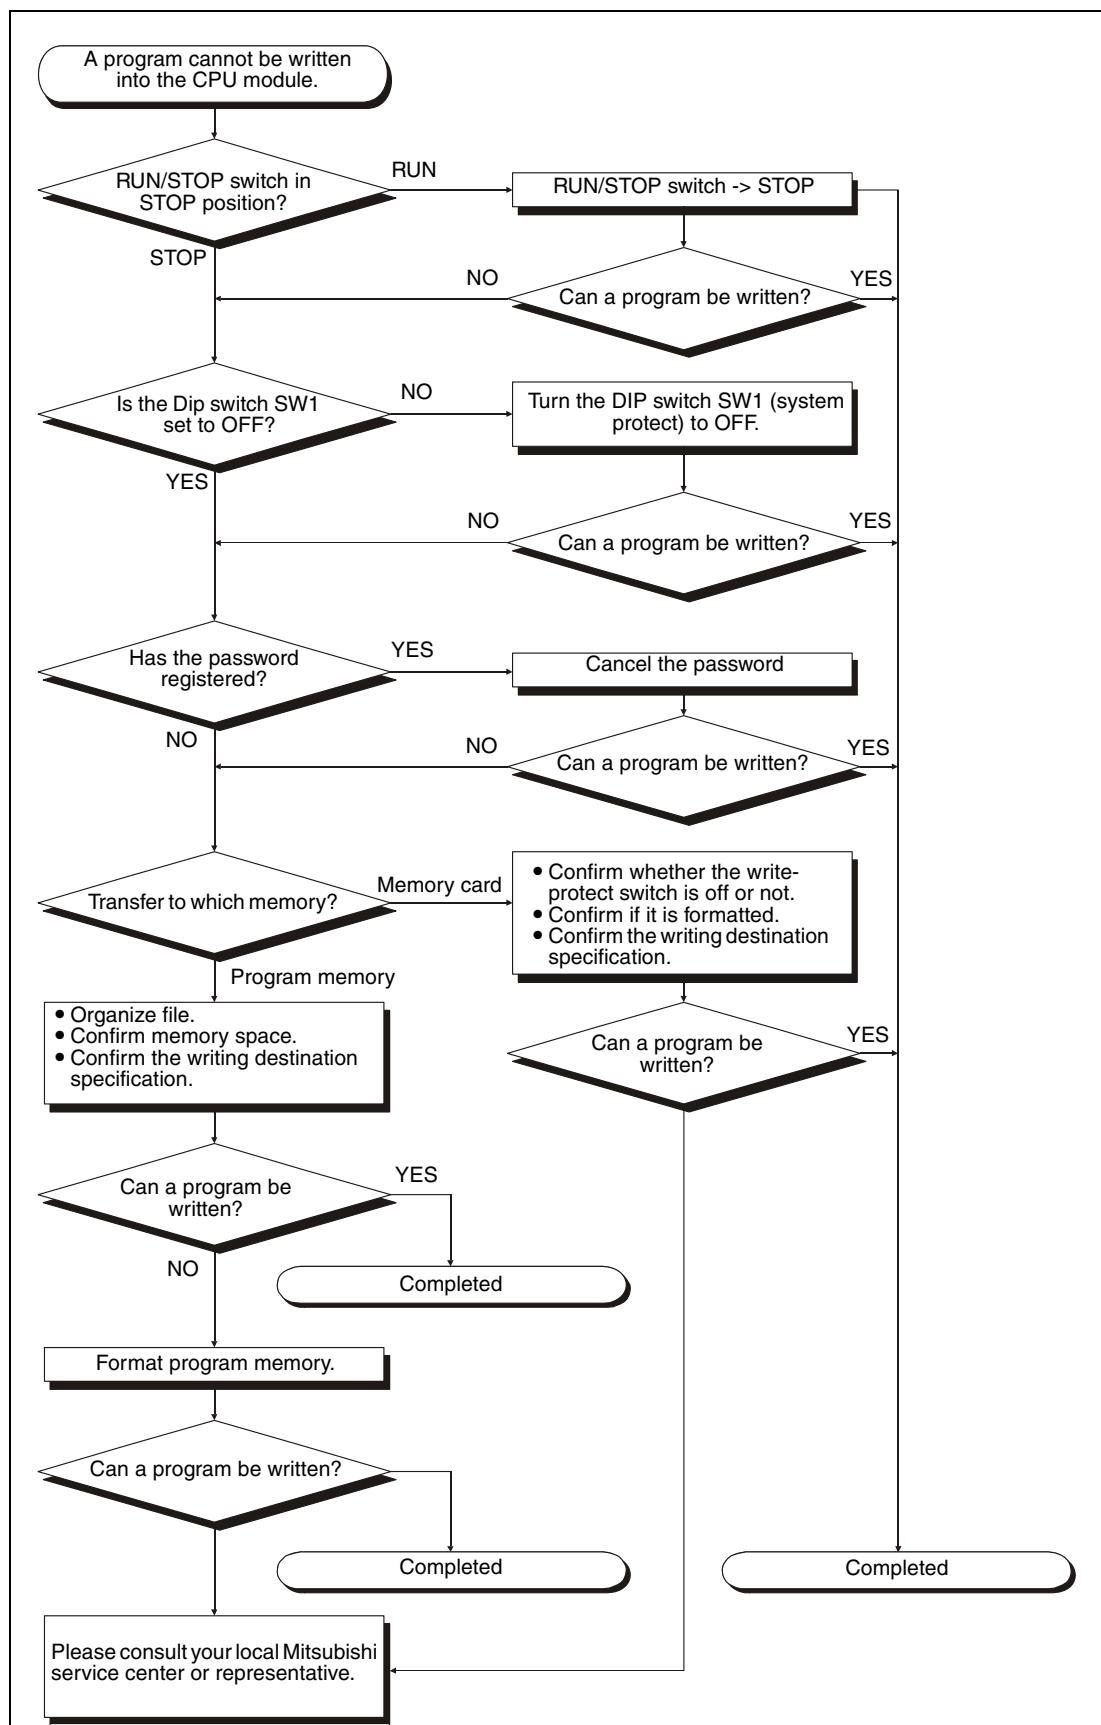

**NOTE**

For the trouble in which input signal to the input module does not turn off: refer to section 11.4.

### 11.2.16 When unable to read a program

### 11.2.17 When unable to write a program into the CPU module

### 11.2.18 When program is rewritten unintentionally

When a program is unintentionally rewritten at power-on or reset of the programmable controller, check special relay SM660.

- When SM660 is OFF ("Program memory execution"): A hardware fault may have occurred. Please consult your local Mitsubishi service center or representative, explaining a detailed description of the problem.
- When SM660 is ON ("During boot operation"): After formatting the program memory that is performing boot operation from the standard ROM, write data to the standard ROM.

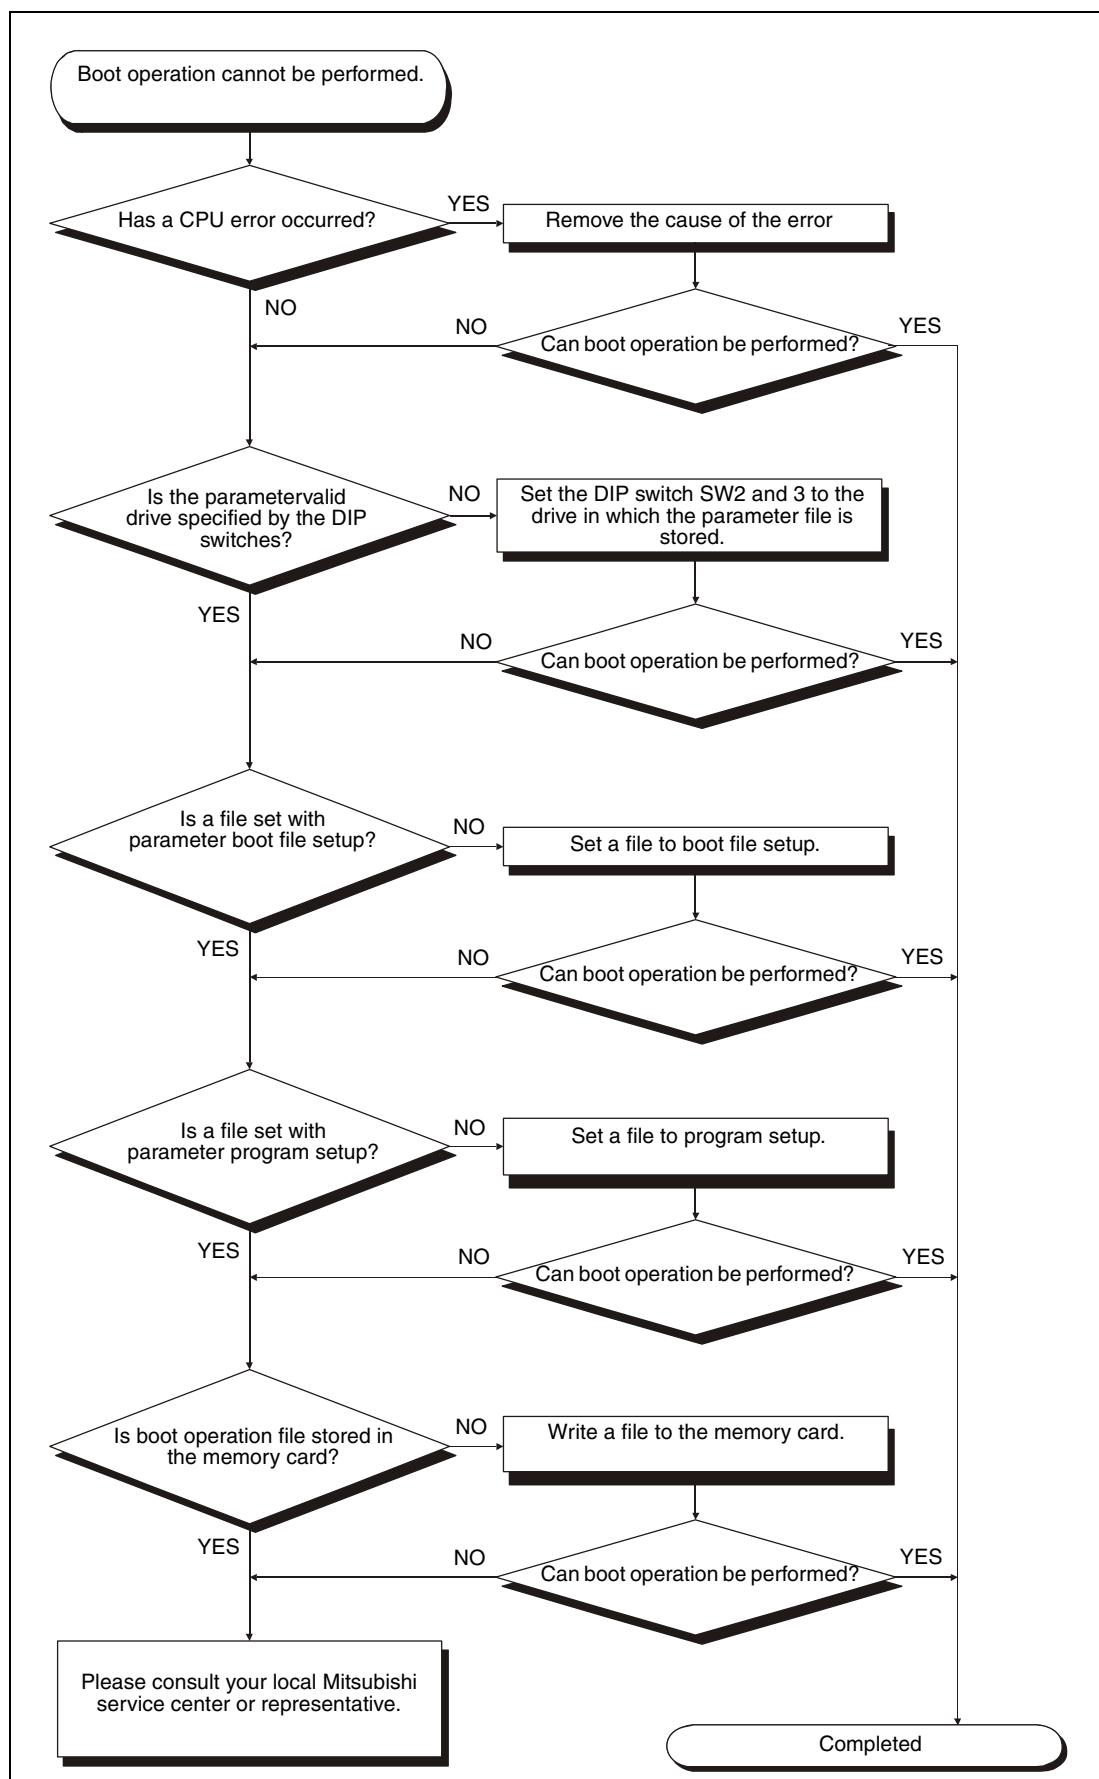

Invalidate the "Perform boot from standard ROM" check box in the boot file setting of the PLC parameter dialog box. Write the parameters and sequence program to the program memory.

Power on the programmable controller/perform reset operation.

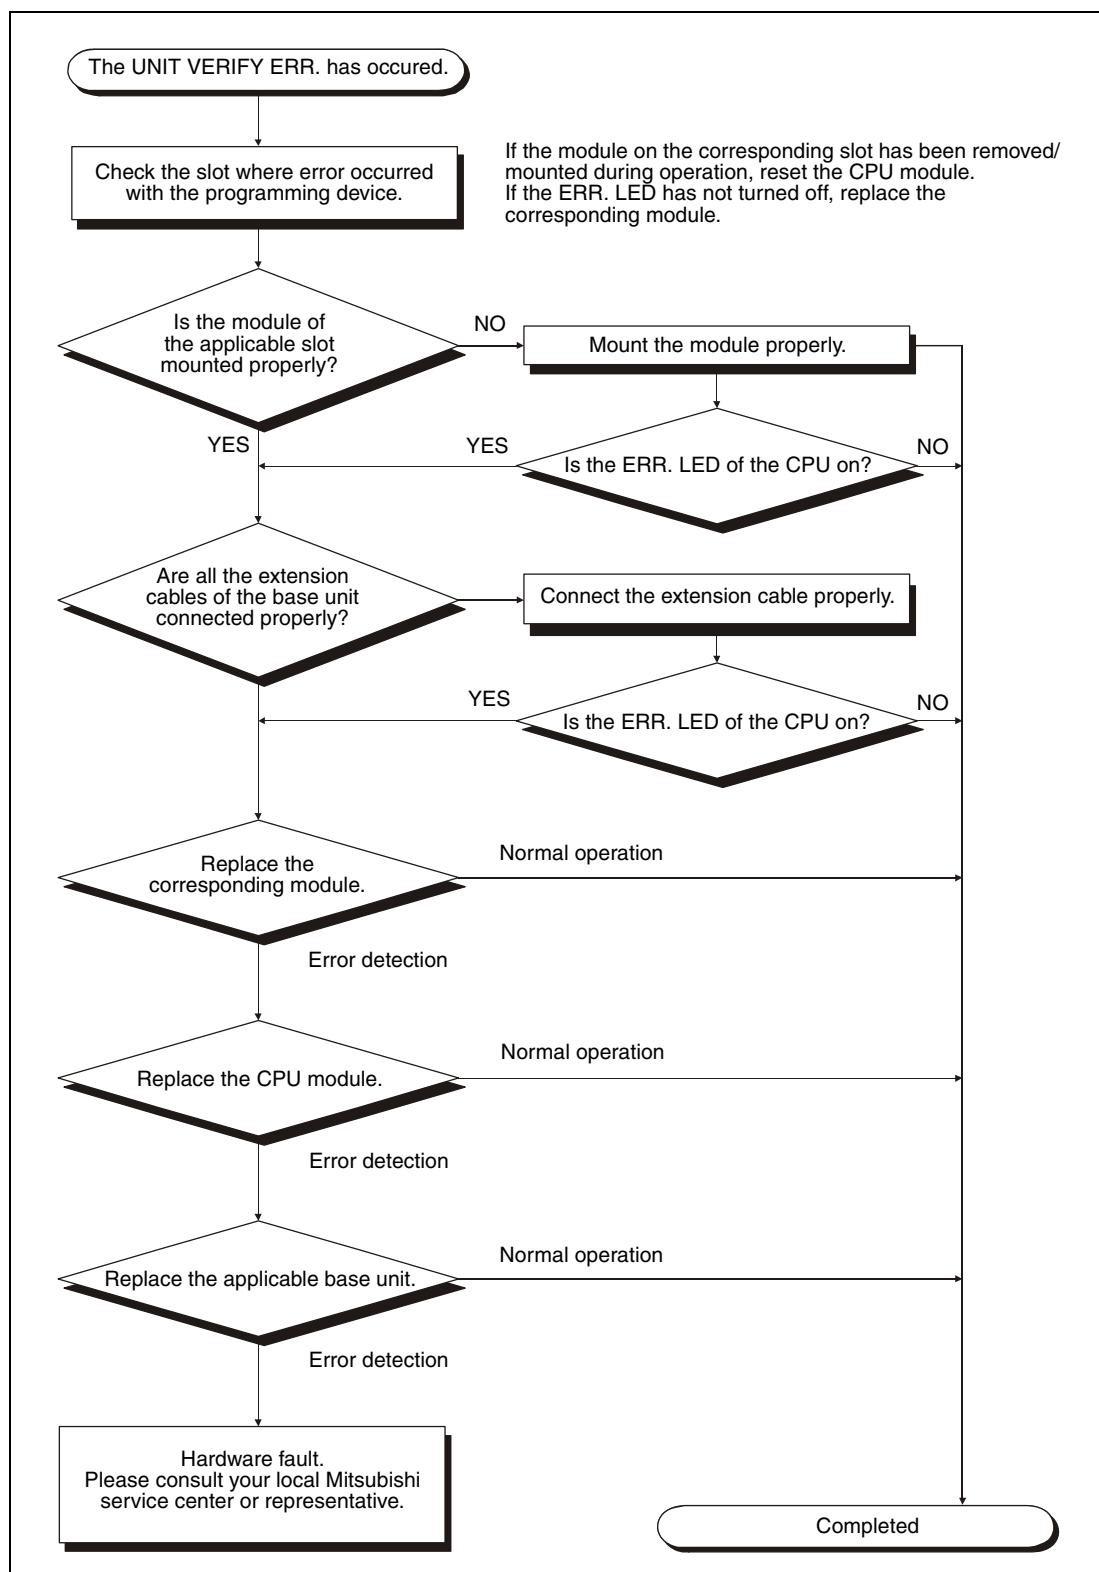

If the program is rewritten a hardware fault may have occurred. Please consult your local Mitsubishi service center or representative, explaining a detailed description of the problem.

If the program is not rewritten, troubleshooting is completed.

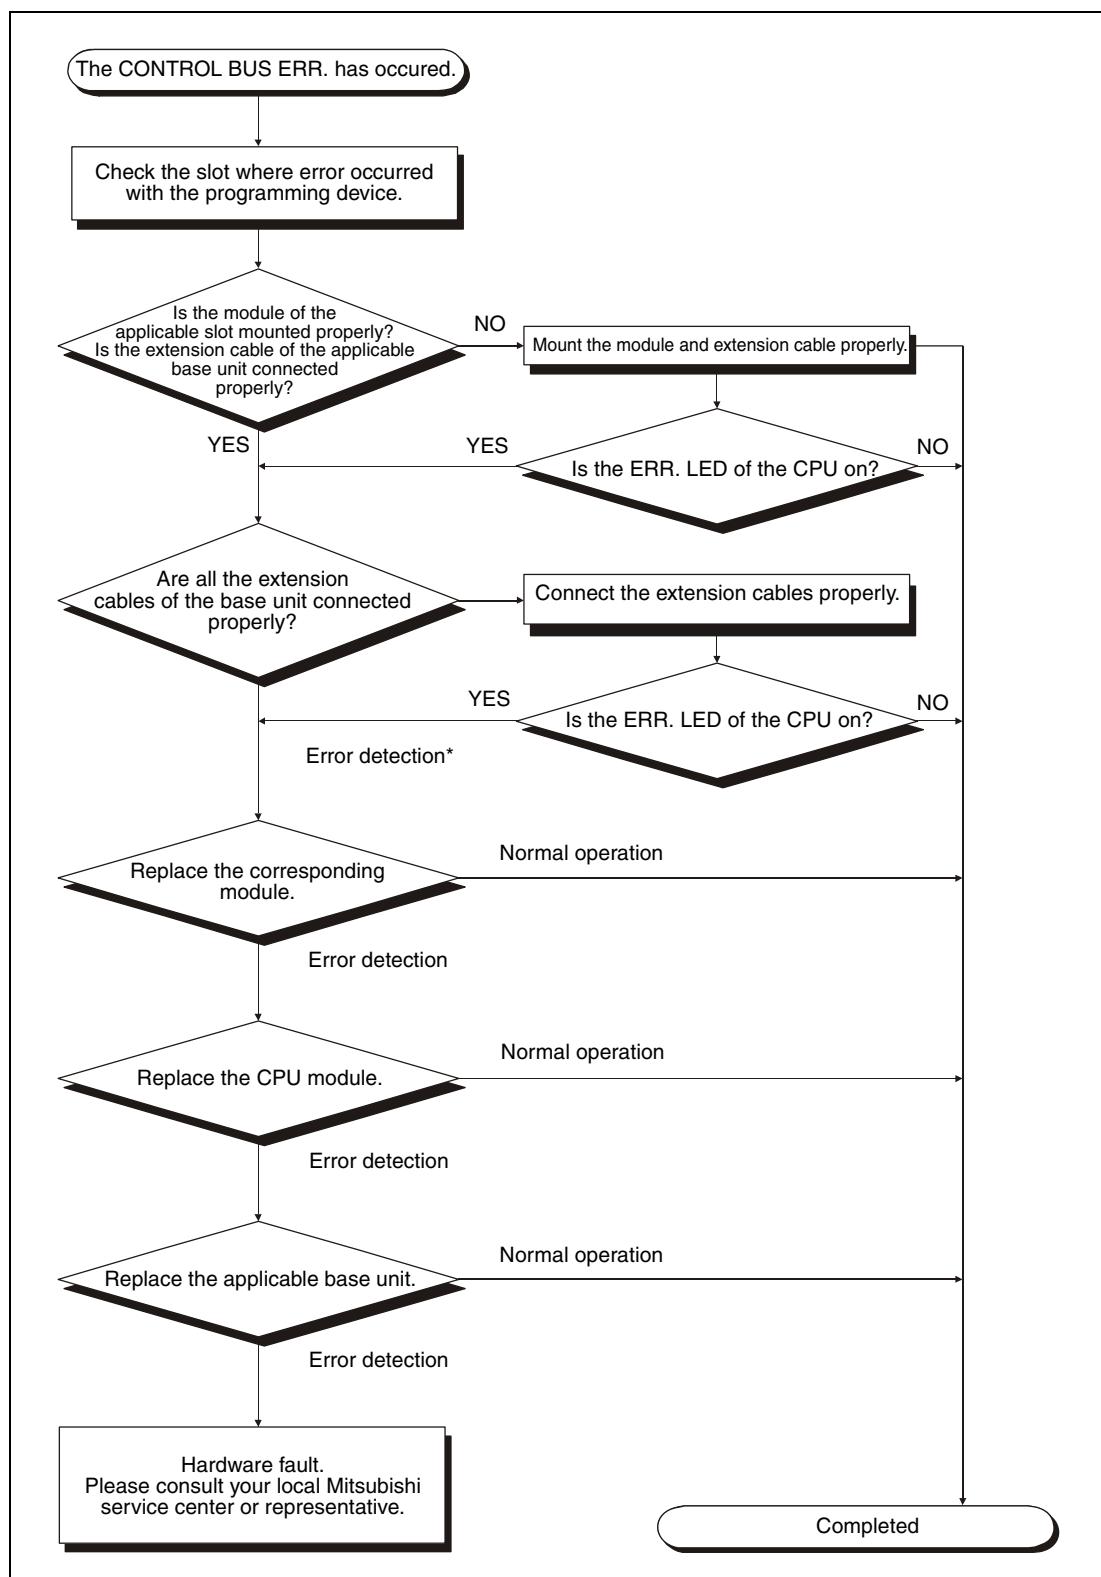

### 11.2.19 When unable to perform boot operation from the memory card

### 11.2.20 When "UNIT VERIFY ERR." has occurred

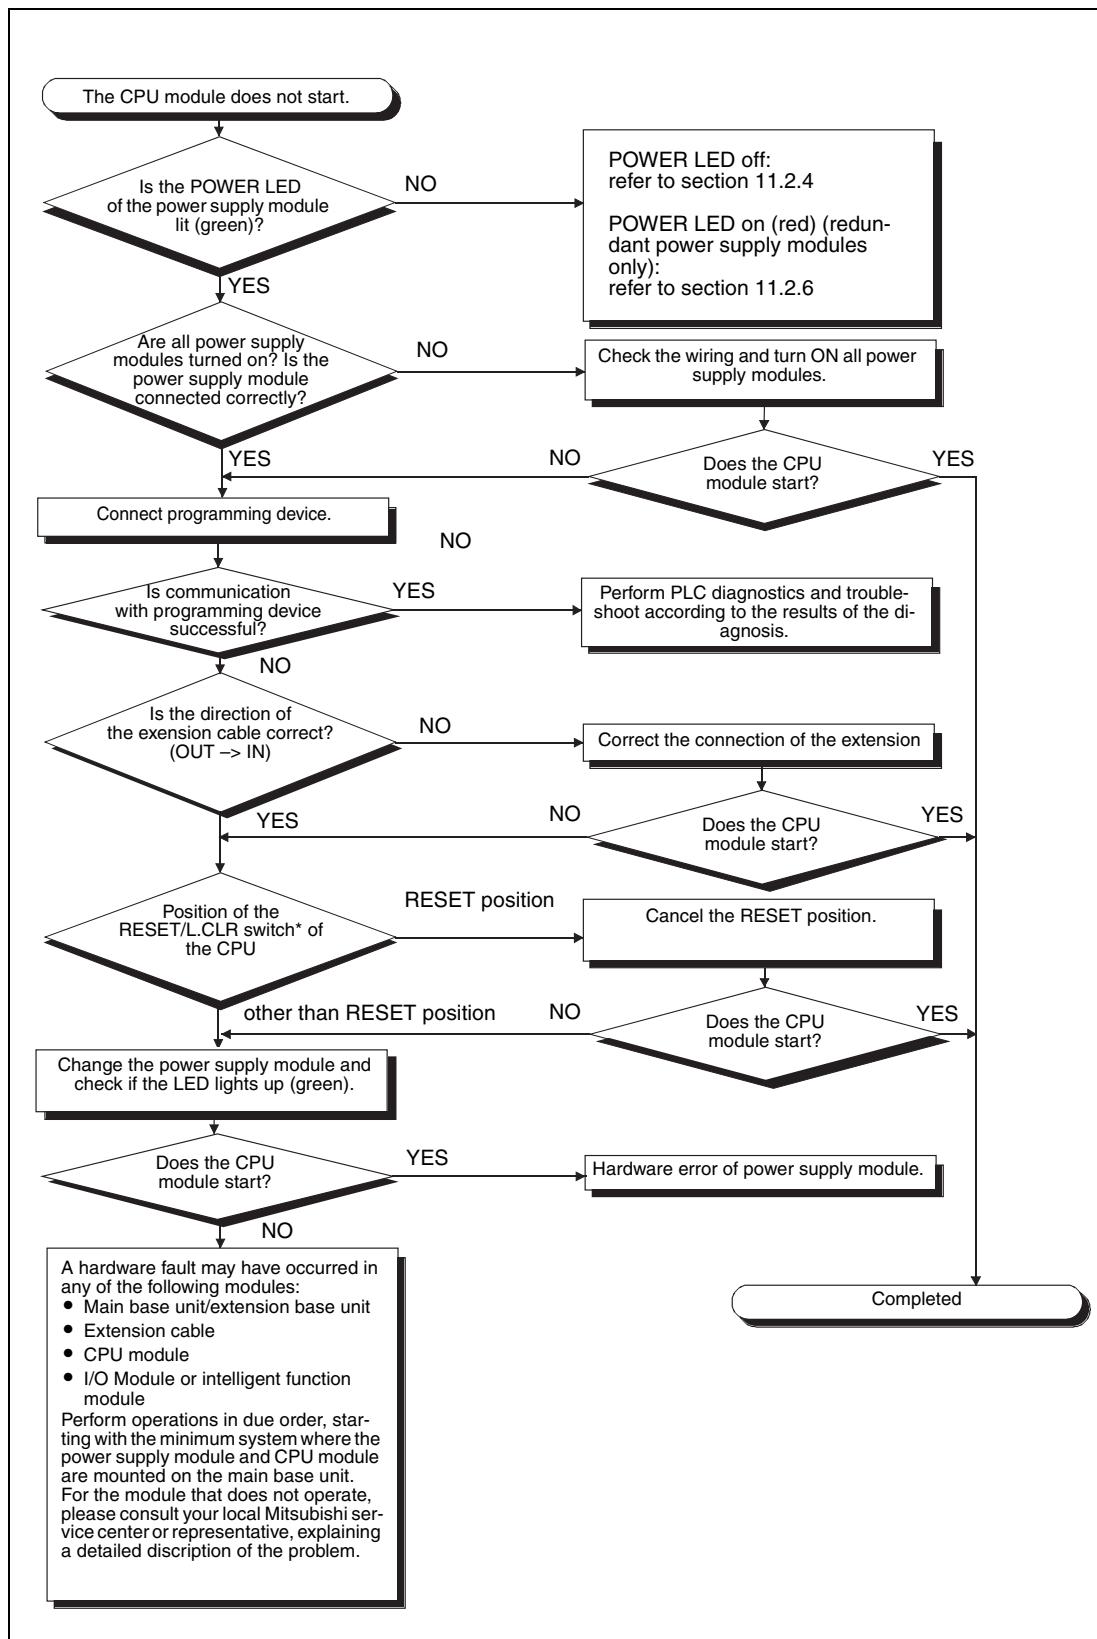

**11.2.21 When "CONTROL BUS ERR." has occurred**

\* May be the failure could be caused by electromagnetic noise. Refer to the notes concerning the wiring in section 9.6.

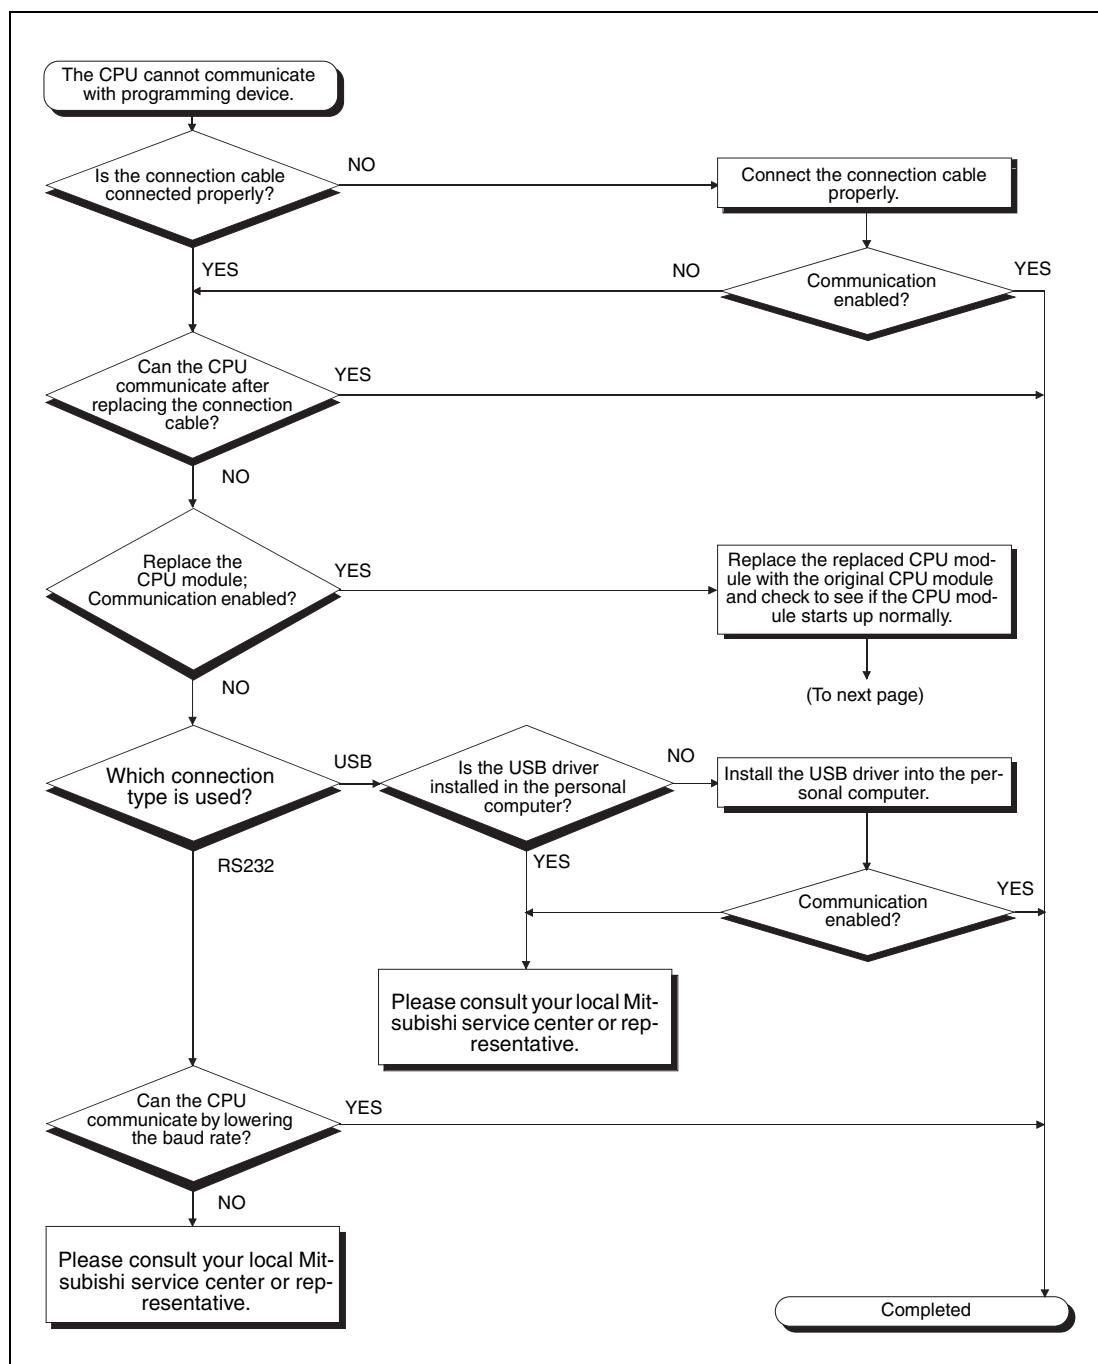

### 11.2.22 When the CPU module does not start

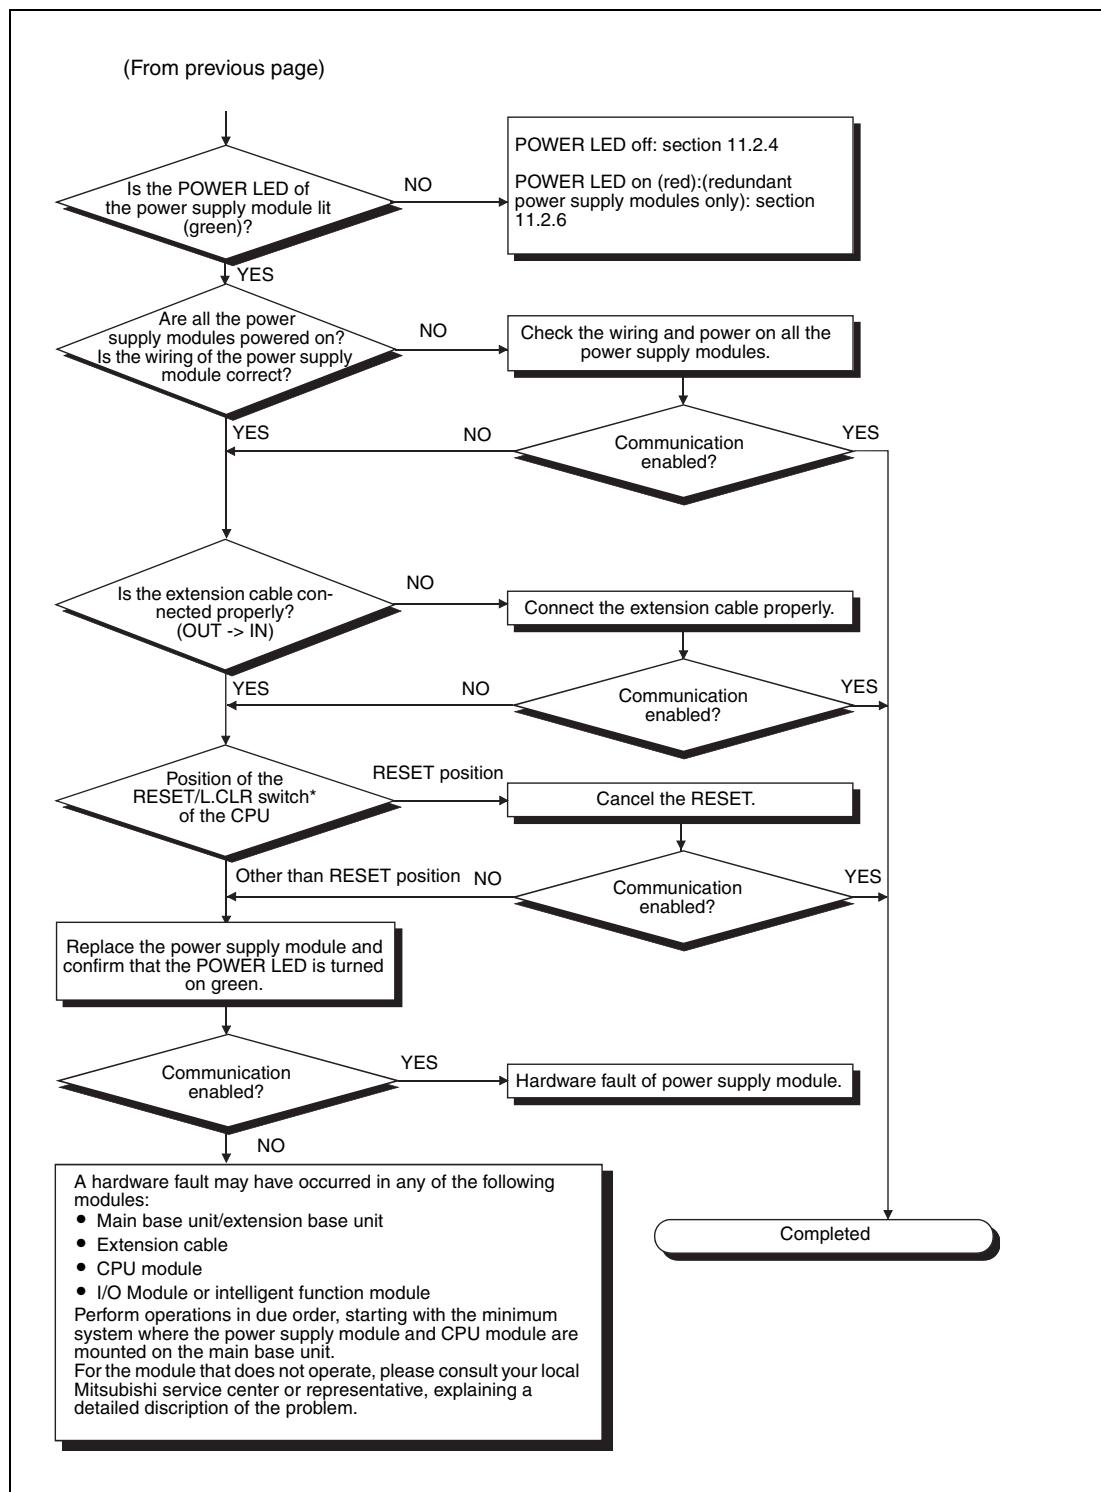

Refer to the following flowchart when the CPU module does not start upon power-on.

\* For the Basic model QCPU, check the RUN/STOP/RESET switch of CPU module

### 11.2.23 When the CPU cannot communicate with GX Developer/GX IEC Developer

\* For the Basic model QCPU, check the RUN/STOP/RESET switch of CPU module

## 11.3 Error code list

The LED on the front side of the CPU indicates an error, recognised by the self diagnostics function of the CPU during transition to RUN mode or during PLC operation. At the same time an error code is saved into special register SD0, which can be displayed together with the appropriate error message by the error diagnostics function of the programming software GX Developer or GX IEC Developer.

The special registers SD5 to SD15 contain general information and the special registers SD16 to SD26 the specific information about the error (refer to column "Error contents and cause" in the error code lists of sections 11.3.1 to 11.3.7).

The sign "●" in the last column of the error code list indicates, that the error code is valid for all CPU types of MELSEC System Q. If a CPU type is mentioned there, this means, that the error code is only valid for this special CPU type.

- Qn(H) = High performance model QCPU Q02-, Q02H-, Q06H-, Q12H- and Q25HCPU
- QnPH = Process CPU module Q02PH-, Q06PH-, Q12PH- and Q25PHCPU
- QnPRH = Redundant CPU module Q12PRH- and Q25PRHCPU
- QnU = Universal model QCPU

The relation between the error detection pattern, error detection location and error code is shown in the following table.

| Error detection pattern                                  | Error detection location      | Error code      | Reference  |
|--|-------------------------------|-----------------|--|
| Detection by the self diagnostics function of CPU module | CPU module                    | 1000 to 1299 ①  | Sections 11.3.1 to 11.3.7  |
|  |                               | 1300 to 10000 ② |  |
| Detection at communication with CPU module               | CPU module                    | 4000H to 4FFFH  | The CPU module returns the error code to the request source.<br><br>Manual of corresponding module |
|  | Serial communication module   | 7000H to 7FFFH  |  |
|  | CC-Link module                | B000H to BFFFH  |  |
|  | ETHERNET module               | C000H to CFFFH  |  |
|  | CC-Link IE controller network | E000H to EFFFH  |  |
|  | MELSECNET/H network module    | F000H to FFFFH  |  |

**Tab. 11-2: Error codes**

- ① Major error: errors that may cause the CPU module to stop the operation.
- ② Minor or moderate error: Errors that may allow the CPU module to continue the operation, e.g., battery error or errors that may cause the CPU module to stop the operation, e.g., WDT error. For determination of the error level (i.e. whether the operation can be continued or stopped) refer to column "CPU status" in the error code lists of sections 11.3.1 to 11.3.7.

### 11.3.1 Error code list (1000 to 1999)

| Error code | Error contents and cause   | Corrective action  | LED status |         | CPU status | Corresponding CPU  |
|------------|--|--|------------|---------|------------|--|
|            |  |  | RUN        | ERR.    |            |  |
| 1000       | <b>MAIN CPU DOWN</b><br>Runaway or failure of CPU module or failure of main CPU <ul style="list-style-type: none"> <li>- Malfunctioning due to noise or other reason</li> <li>- Hardware fault</li> </ul> <b>■ Collateral information</b> <ul style="list-style-type: none"> <li>• Common Information: —</li> <li>• Individual Information: —</li> </ul> <b>■ Diagnostic Timing</b><br>Always  | <ul style="list-style-type: none"> <li>- Take noise reduction measures.</li> <li>- Reset the CPU module and RUN it again. If the same error is displayed again, this suggests a CPU module hardware fault. Contact your local Mitsubishi representative.</li> </ul>  | OFF        | Flicker | Stop       | ●  |
| 1001       | <b>MAIN CPU DOWN</b><br>Runaway or failure of CPU module or failure of main CPU <ul style="list-style-type: none"> <li>- Malfunctioning due to noise or other reason</li> <li>- Hardware fault</li> <li>- Universal model QCPU only:<br/>Accessed to outlying devices with the device range checks disabled (SM237 = 1). ## 11.4 I/O circuit troubleshooting

### 11.4.1 Input circuit troubleshooting

| Example | Condition                       | Cause   | Corrective action   |
|---------|---------------------------------|---|---|
| 1       | Input signal is not turned off. | Leakage current of input switch (e.g. drive by non-contact switch).<br><br><br>AC input<br>Power supply<br>Input module<br>Leakage current  | Connect an appropriate CR so that the voltage across the terminals of the input module becomes lower than the off voltage.<br><br><br>AC input<br>C<br>Input module<br>It is recommended to use 0.1 to 47 $\mu$ F +47 to 120 $\Omega$ (1/2 W) for the CR constant. |
| 2       | Input signal is not turned off. | Drive by a limit switch with neon lamp.<br><br><br>AC input<br>Power supply<br>Input module<br>Leakage current  | <ul style="list-style-type: none"> <li>Same as Example 1 or</li> <li>Provide an independent display circuit separately.</li> </ul>  |
| 3       | Input signal is not turned off. | Leakage current due to line capacity of wiring cable.<br>(Line capacity C of twisted pair wire is approx. 100 pF/m).<br><br><br>AC input<br>Power supply<br>Input module<br>Leakage current | Same as Example 1.<br>(However, leakage current is not generated when the power supply is located in the input equipment side as shown below.)<br><br><br>AC input<br>Power supply<br>Input module<br>C  |
| 4       | Input signal is not turned off. | Drive by a switch with LED display.<br><br><br>DC input<br>Power supply<br>Input module<br>Leakage current  | Connect an appropriate resistor so that the current across the input module becomes lower than the off current.<br><br><br>DC input<br>R<br>Input module<br>* A calculation example of the resistance to be connected is shown on the following page.            |

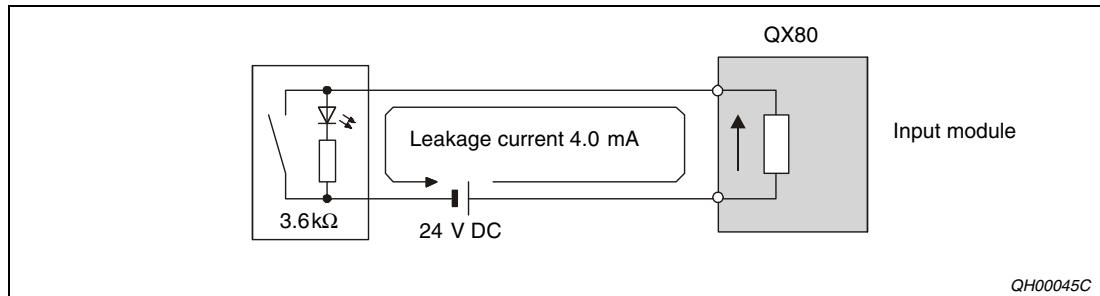

Tab. 11-1: Input circuit troubleshooting

| Example | Condition                                       | Cause  | Corrective action   |
|---------|---|--|---|
| 5       | Input signal is not turned off.                 | Sneak path due to the use of two power supplies.<br><br><br>$U_1 > U_2$                            | Use only one power supply.<br>Connect a sneak path prevention diode.<br><br> |
| 6       | Input signal is not turned on (AC input module) | Stepwise distortion as shown below appears to the zero cross voltage of input signal (AC).<br><br> | Improve input signal waveform by using the online system etc.   |
| 7       | False input due to noise                        | Depending on response time setting, noise is imported as input.  | Change the response time setting.<br>Example: 1 ms to 5 ms  |

**Tab. 11-1: Input circuit troubleshooting**

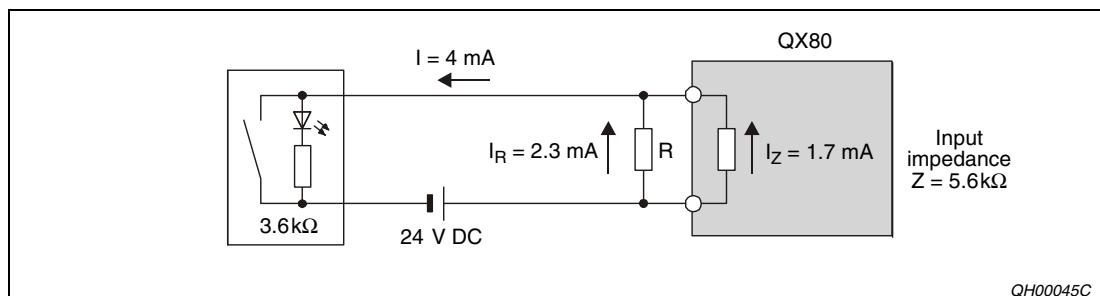

### Calculation example of the resistance to be connected in Example 4

Connecting a switch with LED display, in which a maximum 4.0 mA leakage current flows when 24 V DC is supplied to the QX80.

**Fig. 0-1:** Signal input switch to module input

In this case, the circuit does not satisfy the condition that the off current of the QX80 is 1.7 mA or less. Connect a resistance as follows.

**Fig. 0-2:** Resistor R parallel to input

The current flowing through the resistor R must be minimum 2.3 mA.

$$I_R = I - I_Z = 4 \text{ mA} - 1.7 \text{ mA} = 2.3 \text{ mA}$$

The ratio of the resistors is equivalent to the reverse ratio of the currents:

$$I_R / I_Z = Z / R$$

The result for resistor R is:

$$R = (I_Z / I_R) \times Z = (1.7 \text{ mA} / 2.3 \text{ mA}) \times 5.6 \text{ k}\Omega = 4.14 \text{ k}\Omega$$

The nearest resistor value of the E12 resistor series is 3.9 kΩ. The electric power W of the resistance R can be calculated by the following formula:

$$W = (\text{Input voltage})^2 / R = 28.8^2 \text{ V} / 3.9 \text{ k}\Omega = 0.2 \text{ W}$$

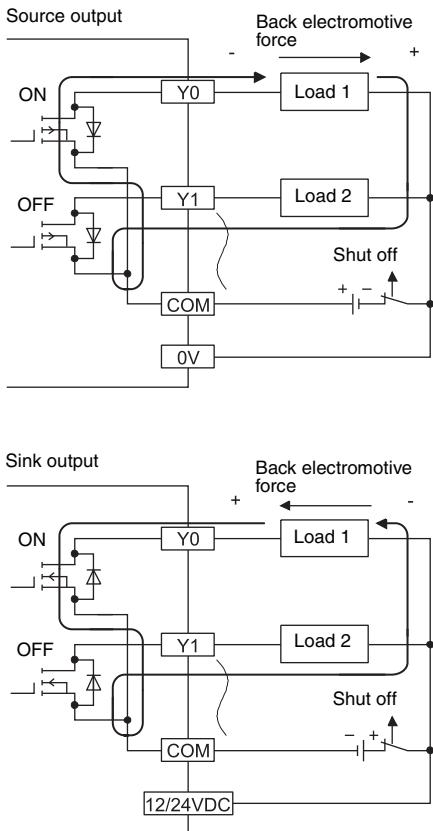

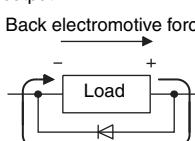

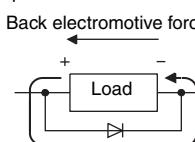

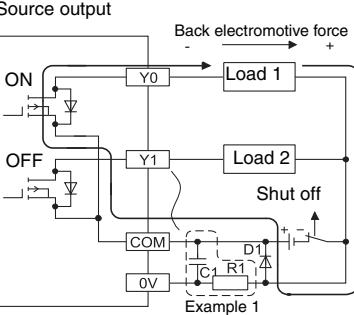

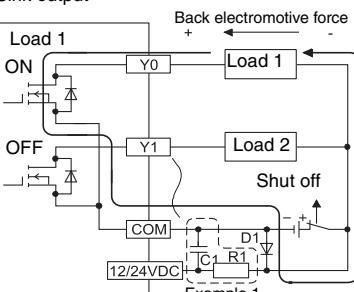

The power dissipation of the resistor should be for safety reasons 3 to 5 times higher, as the real value.

Therefore select a resistor 3.9 kΩ / 1 W for this example.

## 11.4.2 Output circuit troubleshooting

| Example | Condition  | Cause  | Corrective action   |
|---------|--|--|---|
| 1       | When the external power supply turns on, the load is turned on for a moment. | <p>Erroneous output due to the stray capacitance (C) between collector and emitter of photocoupler.<br/>(An erroneous output may occur at high sensitivity load (such as solid state relay)).</p> <p>Output module, Combined module</p> <p>If the external power supply is turned on precipitously, <math>I_c</math> current flows to the next stage of transistor Tr1 gate and Y0 output turns on by 100 <math>\mu</math>s.</p> <p>Switch S ON (External power supply at On)</p> <p>Output Y0</p> | <p>When turning on or off the external power, check that the external power supply rising edge is 10 ms or more, and switch S to the primary side of external power supply.</p> <p>Primary side      Secondary side</p> <p>If the external power supply should be switched on the secondary side, the rise time of the voltage should be extended by RC-circuit to minimum 10 ms.</p> <p>Sink output</p> <p>Source output</p> <p>Calculation of the components:<br/>R1: Several tens of Ohms;<br/>Power capacity<br/><math>= (\text{external power supply current})^2 \times R1 \times (3 \text{ to } 5)</math><br/>C1:<br/>Several hundreds of microfarads, 50 V<br/>Example: <math>R1 = 40 \Omega</math>, <math>C1 = 300 \mu\text{F}</math></p> <p>Use the below expression to calculate a time constant:<br/><math>T = C1 \times R1 = 300 \times 10^{-6} \times 40 = 12 \times 10^{-3} = 12 \text{ ms}</math></p> <p>Measures will not be effective to the Output module QY81P due to the characteristic of external power supply circuit.</p> |

Tab. 11-1: Output circuit troubleshooting

| Example | Condition   | Cause   | Corrective action   |
|---------|---|---|---|
| 2       | The load which was turned off is turned on for a moment at power-off. | <p>The load [2] which was turned OFF may be turned ON due to back electromotive force at the time of power-off if an inductive load [1] is used.</p>  | <p>Take either of the following measure:</p> <ul style="list-style-type: none"> <li>To prevent the generation of the back electromotive force, connect diode in parallel with load where the back electromotive force has been generated.</li> </ul>   <ul style="list-style-type: none"> <li>Connect diode between (+) and (-) of the external power supply so that a sneak path circuit is provided. Connect the diode to C1 and R1 in parallel when example 1 is performed simultaneously.</li> </ul>  <p>* Measures will not be effective to the Output module QY81P due to the characteristic of external power supply circuit.</p>  <p>As for D1, choose a diode with following specifications:</p> <ul style="list-style-type: none"> <li>Reverse current:<br/>Approx. 10 times the rated voltage of the spec.</li> <li>Forward current:<br/>More than 2 times the Max. load current (common) of the spec.</li> </ul> |

Tab. 11-1: Output circuit troubleshooting

| Example | Condition   | Cause  | Corrective action  |
|---------|---|--|--|
| 3       | Excessive voltage is applied to load when output turns off.<br>(Triac output) | The load (e. g. magnetic valve) contains a rectifier for one way (diode). The internal capacitor of the output module is charged by this diode during one sine halfwave. The resulting voltage at the diode during the other halfwave is the voltage of the power supply plus the charged voltage of the capacitor.<br>(This usage does not pose problems to the output components but may deteriorate the diode built in the load, causing burnout, etc.) | Connect a resistor of several ten kΩ to several hundred kΩ at both ends of the load.   |
| 4       | Load does not turn off.<br>(Triac output)                                     | Leakage current due to the built-in surge suppressor   | Connect a resistor at both ends of the load. (If the wiring from the output module to the load is long, be careful since there may be a leakage current due to the line capacity.) |
| 5       | Load does not turn off.<br>(Triac output)                                     | The load current is lower than the minimum load current of the output module.  | Connect a resistor to both ends of a load so that the load current is higher than the minimum load current.  |

# 12 Specifications

## 12.1 General specifications

| Item   | Specification  |                              |                              |
|--|--|------------------------------|------------------------------|
| Operating ambient temperature                        | 0 to +55 °C  |                              |                              |
| Storage ambient temperature                          | −25 to +75 °C  |                              |                              |
| Ambient relative humidity<br>(Operating and Storage) | 5 to 95% (non-condensing)  |                              |                              |
| Vibration resistance                                 | Compliant with JIS B 3502 and IEC61131-2   | Under intermittent vibration |                              |
|  |  | Frequency                    | Acceleration                 |
|  |  | 5 to 9 Hz                    | —                            |
|  |  | 9 to 150 Hz                  | 9.8 m/s <sup>2</sup> (1 g)   |
|  |  | Under continuous vibration   |                              |
|  |  | 5 to 9 Hz                    | 1.75 mm                      |
|  |  | 9 to 150 Hz                  | 4.9 m/s <sup>2</sup> (0.5 g) |
| Shock resistance                                     | Compliant with JIS B 3502 and IEC61131-2:<br>147 m/s <sup>2</sup> (15 g), 3 times in each of 3 directions X, Y, Z      |                              |                              |
| Operating ambience                                   | No corrosive gases etc.  |                              |                              |
| Insulation resistance                                | $\geq 10 \text{ M}\Omega$  |                              |                              |
| Noise durability                                     | By noise simulator (peak value of noise voltage: 500 V ①, noise width: 1 $\mu\text{s}$ , noise frequency: 25 to 60 Hz) |                              |                              |
| Operating altitude                                   | 2000 m max.  |                              |                              |
| Installation location                                | Inside control panel   |                              |                              |
| Oversupply category ②                                | II max.  |                              |                              |
| Pollution level ③                                    | 2 max.   |                              |                              |
| Cooling system                                       | Self cooling   |                              |                              |

**Tab. 12-1: General specifications**

- ① With the models QX10, QX10-TS, QX28, QY10, QY10-TS, QY18A and QY22 the peak value of the noise voltage is 1500 V.
- ② This indicates the section of the power supply to which the equipment is assumed to be connected between the public electrical power distribution network and the machinery within premises. Category II applies to equipment for which electrical power is supplied from fixed facilities. The surge voltage withstand level for up to the rated voltage of 300 V is 2500 V.
- ③ This index indicates the degree to which conductive material is generated in terms of the environment in which the equipment is used. Pollution level 2 is when only non-conductive pollution occurs. A temporary conductivity caused by condensing must be expected occasionally.

## 12.2 Hardware specifications of the CPU modules

### 12.2.1 Basic model QCPU

| Item  | Q00JCPU  | Q00CPU                                      | Q01CPU  |  |  |  |

## 12.3 Input/output module specifications

### 12.3.1 Digital input module QX10

| Item   |          | QX10  |
|--|----------|---|
| Number of input points   |          | 16  |
| Isolation method   |          | Photocoupler  |
| Rated input voltage  |          | 110–120 V AC (+10/-15 %), 50/60 Hz ( $\pm 3$ Hz), distortion within 5 % |
| Rated input current  |          | approx. 7 mA (at 100 V AC, 50 Hz); approx. 8 mA (at 100 V AC, 60 Hz)    |
| Max. simultaneously ON   |          | Refer to the derating chart   |
| Inrush current   |          | max. 200 mA within 1 ms (at 132V AC)                                    |
| ON voltage/ON current  |          | $\geq 80$ V AC / $\geq 5$ mA (50 Hz / 60 Hz)                            |
| OFF voltage/OFF current  |          | $\leq 30$ V AC / $\leq 1.7$ mA (50 Hz / 60 Hz)                          |
| Input impedance  |          | approx. 15 k $\Omega$ at 50 Hz, approx. 12 k $\Omega$ at 60 Hz          |
| Response time  | OFF → ON | $\leq 15$ ms (100 V AC, 50 Hz / 60 Hz)                                  |
|  | ON → OFF | $\leq 20$ ms (100 V AC, 50 Hz / 60 Hz)                                  |
| Groups of input  |          | 1; 16 points/common<br>(common terminal: TB17)                          |
| Input status display   |          | One LED per input   |
| Dielectric withstand voltage   |          | 1780 V AC rms/3 cycles (altitude 2000 m)                                |
| External connections   |          | 18-point removable terminal block with screws (M3 x 6 screws)           |
| Applicable wire size   |          | 0.3 to 0.75 mm <sup>2</sup> core (outside diameter: 2.8 mm max.)        |
| Internal current consumption<br>(5 V DC)   |          | 50 mA (all input points ON)   |
| Weight   |          | 0.17 kg   |
| <b>External Connections</b>  |          |   |
|  |          |   |
| Terminal block number  | Signal   |   |
| TB1  | X00      |   |
| TB2  | X01      |   |
| TB3  | X02      |   |
| TB4  | X03      |   |
| TB5  | X04      |   |
| TB6  | X05      |   |
| TB7  | X06      |   |
| TB8  | X07      |   |
| TB9  | X08      |   |
| TB10   | X09      |   |
| TB11   | X0A      |   |
| TB12   | X0B      |   |
| TB13   | X0C      |   |
| TB14   | X0D      |   |
| TB15   | X0E      |   |
| TB16   | X0F      |   |
| TB17   | COM      |   |
| TB18   | Vacant   |   |

Tab. 12-21: Input module QX71

① The response times OFF → ON and ON → OFF can't be set to different values.

#### NOTE

The connector is no D-sub type.

### 12.3.13 Digital input module QX72

| Item  | QX72  |  |  |  |
|---|---|--|--|--|
| Number of input points  | 64  |  |  |  |
| Isolation method  | Photocoupler  |  |  |  |
| Rated input voltage   | 5 V and 12 V DC (+20/-15 %, ripple ratio within 5 %)              |  |  |  |
| Rated input current   | at 5 V DC: approx. 1.2 mA<br>at 12 V DC: approx. 3.3 mA           |  |  |  |
| Max. simultaneously ON  | All inputs can be switched on simultaneously.                     |  |  |  |
| Inrush current  | —   |  |  |  |
| ON voltage/ON current   | $\geq 3.5$ V DC / $\geq 3$ mA                                     |  |  |  |
| OFF voltage/OFF current   | $\leq 1$ V DC / $\leq 0.1$ mA                                     |  |  |  |
| Input impedance   | approx. 3.3 k $\Omega$  |  |  |  |
| Response time   | OFF → ON  | 1, 5, 10, 20, 70 ms<br>(Response time setting by parameters, initial setting: 10 ms) ① |  |  |
|   | ON → OFF  | 1, 5, 10, 20, 70 ms<br>(Response time setting by parameters, initial setting: 10 ms) ① |  |  |
| Groups of input   | 2; 32 points/common<br>(common terminal: 1B01/1B02 and 2B01/2B02) |  |  |  |
| Input status display  | One LED per input of a group, Groups are switchable               |  |  |  |
| Dielectric withstand voltage  | 560 V AC rms/3 cycles (altitude 2000 m)                           |  |  |  |
| External connections  | Two 40-pin connectors   |  |  |  |
| Applicable wire size  | 0.3 mm <sup>2</sup>   |  |  |  |
| Accessories   | External wiring connector   |  |  |  |
| Internal current consumption<br>(5 V DC)  | 85 mA (all input points ON)                                       |  |  |  |
| Weight  | 0.13 kg   |  |  |  |
| <b>External connections</b>   |   |  |  |  |

### 12.3.17 Digital input module QX82

| Item  |   | QX82   |
|---|---|--|
| Number of input points  | 64  |  |
| Isolation method  | Photocoupler  |  |
| Rated input voltage   | 24 V DC (+20/-15 %, ripple ratio within 5 %)  |  |
| Rated input current   | approx. 4 mA  |  |
| Max. simultaneously ON  | Refer to the derating chart   |  |
| Inrush current  | —   |  |
| ON voltage/ON current   | $\geq 19$ V DC / $\geq 3$ mA  |  |
| OFF voltage/OFF current   | $\leq 11$ V DC / $\leq 1.7$ mA  |  |
| Input impedance   | approx. 5.6 k $\Omega$  |  |
| Response time   | OFF → ON  | 1, 5, 10, 20, 70 ms<br>(Response time setting by parameters, initial setting: 10 ms) ① |
|   | ON → OFF  | 1, 5, 10, 20, 70 ms<br>(Response time setting by parameters, initial setting: 10 ms) ① |
| Groups of input   | 2; 32 points/common<br>(common terminal: 1B01/1B02 and 2B01/2B02)   |  |
| Input status display  | One LED per input of a group, Groups are switchable   |  |
| Dielectric withstand voltage  | 560 V AC rms/3 cycles (altitude 2000 m)   |  |
| External connections  | Two 40-pin connectors   |  |
| Applicable wire size  | 0.3 mm <sup>2</sup>   |  |
| Accessories   | <ul style="list-style-type: none"> <li>• Connector A6CON</li> <li>• Assembled cable Q40-CBL-3M/5M with 40 pin plug</li> </ul> |  |
| Internal current consumption<br>(5 V DC)  | 90 mA (all input points ON)   |  |
| Weight  | 0.18 kg   |  |
| <b>External connections</b>   |   |  |
| <p>Indication selector switch<br/>Used to switch the LED indications:<br/>F: Inputs X00 to X1F<br/>L: Inputs X20 to X3F</p> <p>Input module</p> |   |  |

**Tab. 12-30:** Connector pin outs of the module QX82-S1**NOTE**

The connectors are no D-sub type.

### 12.3.19 Relay output module QY10

| Item                                     |  | QY10   |
|--|--|--|
| Number of outputs                        | 16   |  |
| Isolation method                         | Relay  |  |
| Rated switching voltage, current         | 24 V DC, 2 A (resistive load) per output, 220 V AC, 2 A ( $\cos \varphi = 1$ ) per output<br>8 A/group |  |
| Minimum switching load                   | 5 V DC, 1 mA   |  |
| Maximum switching load                   | 264 V AC, 125 V DC   |  |
| Response time                            | OFF → ON   | ≤ 10 ms  |
|  | ON → OFF   | ≤ 12 ms  |
| Life                                     | Mechanical   | 20 million times or more   |
|  | Electrical   | Rated switching voltage/current load; 100 thousand times or more                       |
|  |  | 200 V AC, 1.5 A; 240 V AC, 1 A ( $\cos \varphi = 0.7$ ) 100 thousand times or more     |
|  |  | 200 V AC, 0.4 A; 240 V AC, 0.3 A ( $\cos \varphi = 0.7$ ) 300 thousand times or more   |
|  |  | 200 V AC, 1 A; 240 V AC, 0.5 A ( $\cos \varphi = 0.35$ ) 100 thousand times or more    |
|  |  | 200 V AC, 0.3 A; 240 V AC, 0.15 A ( $\cos \varphi = 0.35$ ) 300 thousand times or more |
|  |  | 24 V DC, 1 A; 100 V DC, 0.1 A (L/R = 7 ms) 100 thousand times or more                  |
|  |  | 24 V DC, 0.3 A; 100 V DC, 0.03 A (L/R = 7 ms) 300 thousand times or more               |
| Maximum switching frequency              | 3600 times/hour  |  |
| Surge suppressor                         | —  |  |
| Fuse                                     | —  |  |
| Groups of outputs                        | 1; 16 points/common<br>(common terminal: TB17)   |  |
| Output status display                    | One LED per output   |  |
| Dielectric withstand voltage             | 2830 V AC rms/3 cycles (altitude 2000 m)   |  |
| External connections                     | 18-point removable terminal block with screws (M3x6)   |  |
| Applicable wire size                     | Core cable: 0.3 to 0.75 mm <sup>2</sup> , (outside diameter: 2.8 mm max.)                              |  |
| Internal current consumption<br>(5 V DC) | 430 mA (all output points ON)  |  |
| Weight                                   | 0.22 kg  |  |

Tab. 12-36: Relay output module QY18A connections

### 12.3.22 Triac output module QY22

| Item                                     | QY22  |
|--|---|
| Number of outputs                        | 16  |
| Isolation method                         | Photocoupler  |
| Rated load voltage                       | 100–240 V AC (+20/-15 %)  |
| Maximum load current                     | 0.6 A per output, 4.8 A per module                                      |
| Minimum switching load                   | 24 V AC (100 mA); 100 V AC (25 mA); 240 V AC (25 mA)                    |
| Maximum inrush current                   | 20 A  |
| Leakage current at OFF                   | ≤ 3 mA (120 V AC, 60 Hz), ≤ 1.5 mA (240 V AC, 60 Hz)                    |
| Maximum voltage drop at ON               | 1.5 V   |
| Response time                            | OFF → ON  |
|  | ON → OFF  |
| Surge suppressor                         | CR absorber   |
| Fuse                                     | —   |
| Groups of outputs                        | 1; 16 points/common,<br>(common terminal: TB17)                         |
| Output status display                    | One LED per output  |
| Dielectric withstand voltage             | 2830 V AC rms/3 cycles (altitude 2000 m)                                |
| External connections                     | 18-point removable terminal block with screws (M3x6)                    |
| Applicable wire size                     | Core cable: 0.3 to 0.75 mm <sup>2</sup> (outside diameter: 2.8 mm max.) |
| Internal current consumption<br>(5 V DC) | 250 mA (all output points ON)   |
| Weight                                   | 0.40 kg   |

**Tab. 12-37:** Triac output module QY22

| External connections | Terminal block number | Signal |
|----------------------|-----------------------|--------|
|                      | TB1                   | Y00    |
|                      | TB2                   | Y01    |

**Tab. 12-47:** Connector pin outs of the module QY42P**NOTE**

The connectors are no D-sub type.

### 12.3.27 Transistor output module QY50

| Item                                  | QY50 ①  |
|---------------------------------------|---|
| Number of outputs                     | 16  |
| Isolation method                      | Photocoupler  |
| Rated load voltage                    | 12–24 V DC (+20/-15 %)  |
| Maximum load current                  | 0.5 A per output, 4 A per group   |
| Maximum inrush current                | 4 A, 10 ms or less  |
| Leakage current at OFF                | ≤ 0.1 mA  |
| Maximum voltage drop at ON            | ≤ 0.3 V at 0.5 ,  |
| Response time                         | OFF → ON ≤ 1 ms   |
|                                       | ON → OFF ≤ 1 ms (rated load, resistive load)                            |
| Surge suppressor                      | Zener Diode   |
| Fuse                                  | Two fuses 4 A parallel (nominal fuse current = 6.7 A), unchangeable ②   |
| Fuse blow indication                  | LED indicates it and signal is output to CPU                            |
| Groups of outputs                     | 1; 16 points/common,<br>(common terminal: TB18)                         |
| Output status display                 | One LED per output  |
| Dielectric withstand voltage          | 560 V AC rms/3 cycles (altitude 2000 m)                                 |
| External connections                  | 18-point removable terminal block with screws (M3x6)                    |
| Applicable wire size                  | Core cable: 0.3 to 0.75 mm <sup>2</sup> (outside diameter: 2.8 mm max.) |
| External power supply                 | Voltage 12–24 V DC (+20/-15 %, ripple ratio within 5 %)                 |
|                                       | Current 20 mA (at 24 V DC; all output points ON)                        |
| Internal current consumption (5 V DC) | 80 mA (all output points ON)  |
| Weight                                | 0.17 kg   |

**Tab. 12-48:** Transistor output module QY50

① Sink type

② The fuses inside the output module are unchangeable. They protect the external peripherals, if there occurs a short circuit in the module.  
The output module itself has no overload protection.

| External connections | Terminal block number | Signal          |
|----------------------|-----------------------|-----------------|
|                      |                       | TB1 Y00         |
|                      |                       | TB2 Y01         |
|                      |                       | TB3 Y02         |
|                      |                       | TB4 Y03         |
|                      |                       | TB5 Y04         |

**Tab. 12-56:** Transistor output module QY80

① Source type

② The fuses inside the output module are unchangeable. They protect the external peripherals, if there occurs a short circuit in the module. The output module itself has no overload protection.

| External connections   | Terminal block number | Signal |
|--|-----------------------|--------|
| <p>The diagram illustrates the internal circuit of the QY80 module. It features a central 'Internal circuit' block. On the left, an LED is connected in series with one output path. On the right, a 12/24 V DC power source is connected to the module. The outputs are organized into four groups of four, each connected to a terminal block (TB) labeled TB1 through TB18. TB1, TB2, TB3, TB4, TB5, TB6, TB7, TB8, TB9, TB10, TB11, TB12, TB13, TB14, TB15, TB16, and TB17 are connected to the top row of the 18-pin terminal block. TB17 is also connected to the common terminal (COM). TB18 is connected to the bottom row of the terminal block and is labeled '0 V'.</p> | TB1                   | Y00    |
|  | TB2                   | Y01    |

**Tab. 12-65:** External connections and circuit diagram of the input/output module QX48Y57

### 12.3.36 Dummy module QG60

The module QG60 is a blank cover module used to protect the vacant slot (between I/O modules) of the base unit from dust.

Load the blank cover module with the connector cover of the base module fitted.

| Item                             | QG60   |
|----------------------------------|--|
| I/O points                       | Set by parameters  |
| Application                      | Used to protect any vacant slots on the base unit from dust. |
| Weight [kg]                      | 0.07   |
| External dimensions (WxHxD) [mm] | 27.4x98x9  |

**Tab. 12-67: Power supply module specifications (1)**

① When power is switched on again immediately (within 5 seconds) after power-off, an inrush current of more than the specified value (2 ms or less) may flow.

Reapply power 5 or more seconds after power-off.

When selecting a fuse and breaker in the external circuit, take account of the blowout, detection characteristics etc.

② Overcurrent protection

The overcurrent protection device shuts off the 5 V, 24 VDC circuit and stops the system if the current flowing in the circuit exceeds the specified value.

The LED of the power supply module turns off or turns on in dim green when voltage is lowered. If this device is activated, switch the input power supply off and eliminate the cause such as insufficient current capacity or short. Then, a few minutes later, switch it on to restart the system.

③ Overvoltage protection

The overvoltage protection device shuts off the 5 V DC circuit and stops the system if a voltage of 5.5 V DC is applied to the circuit.

When this device is activated, the power supply module LED turns off. If this happens, switch the input power off, then a few minutes later on. This causes the initial start for the system to take place.

The power supply module must be changed if the system is not booted and the LED remains off.

④ If the momentary power failure time is within 20 ms, the system detects an AC down and suspends the operation processing. However, the system continues operations after the power comes back.

If the momentary power failure time exceeds 20 ms, the system either continues or initially starts operations depending on the power supply load. In case that the operation processing is continued, the system operates the same as when the momentary power failure time is within 20 ms.

Supplying the same amount of AC to both the power supply module and the input module (such as QX10) can prevent the sensor connected to the input module from being switched to the OFF status when the power supply turns off.

Note, however, that if only the input module (such as QX10) is connected on the AC line, which is connected to the power supply, an AC down detection in the power supply module may be delayed due to the internal capacitor of the input module. To avoid this, connect a load of approx. 30 mA per input module on the AC line.

**Power supply modules Q62P, Q63P, Q64P and Q64PN**

| Item   | Q62P   | Q63P   | Q64P              | Q64PN                    |

**Tab. 12-68: Power supply module specifications (2)**

- ① When power is switched on again immediately (within 5 seconds) after power-off, an inrush current of more than the specified value (2 ms or less) may flow.  
Reapply power 5 or more seconds after power-off.  
When selecting a fuse and breaker in the external circuit, take account of the blowout, detection characteristics etc.
- ② Overcurrent protection  
The overcurrent protection device shuts off the 5 V, 24 V DC circuit and stops the system if the current flowing in the circuit exceeds the specified value.  
The LED of the power supply module turns off or turns on in dim green when voltage is lowered. If this device is activated, switch the input power supply off and eliminate the cause such as insufficient current capacity or short. Then, a few minutes later, switch it on to restart the system.

③ Overvoltage protection

The overvoltage protection device shuts off the 5 V DC circuit and stops the system if a voltage of 5.5 V DC is applied to the circuit.

When this device is activated, the power supply module LED turns off. If this happens, switch the input power off, then a few minutes later on. This causes the initial start for the system to take place.

The power supply module must be changed if the system is not booted and the LED remains off.

④ If the momentary power failure time is within the period given in the table above, the system detects an AC down and suspends the operation processing.

If the momentary power failure time exceeds the period given in the table above, the system either continues or initially starts operations depending on the power supply load. In case that the operation processing is continued, the system operates the same as when the momentary power failure time is within 20 ms (resp. 10 ms for Q63RP).

For AC input power supply:

Supplying the same amount of AC to both the power supply module and the input module (such as QX10) can prevent the sensor connected to the input module from being switched to the OFF status when the power supply turns off.

Note, however, that if only the input module (such as QX10) is connected on the AC line, which is connected to the power supply, an AC down detection in the power supply module may be delayed due to the internal capacitor of the input module. To avoid this, connect a load of approx. 30 mA per input module on the AC line.

For DC input power supply:

The allowable momentary power failure period is the time when 24 V DC is input. If the input is less than 24 V DC, the time will be shorter.)

### Redundant power supply modules Q63RP and Q64RP

| Item   | Q63RP  | Q64RP  |
|--|--|--|
| Mounting position  | Power supply module mounting slot "POWER"                              |  |

| Rated output current   | 5 V DC   | 8.5 A  |
|  | 24 V DC  | —  |
| External output voltage  | —  | —  |
| Overcurrent protection ②   | 5 V DC   | ≥ 9.35 A   |
|  | 24 V DC  | —  |
| Overvoltage protection ③   | 5.5 to 6.5 V   |  |
| Efficiency   | ≥ 65 %   |  |
| Dielectric withstand voltage (Across primary and secondary connection) | 500 V AC, 1 min  | 2830 V AC, 1 min   |
| Operation indication   | The "POWER" LED turns on in green, when the output voltage is present. |  |
| Contact output section   | Application  | Error contact (refer to chapter 7)   |
|  | Rated switching voltage, current                                       | 24 V DC; 0.5 A   |
|  | Minimum switching load   | 5 V DC; 1 mA   |
|  | Response time  | OFF → ON: ≤ 10 ms<br>ON → OFF: ≤ 12 ms   |
|  | Life   | Mechanical: More than 20 million times<br>Electrical: More than 100 thousand times at rated switching voltage, current |
|  | Overvoltage protection   | —  |
|  | Fuse   | The signal output is not protected by fuse.  |
| Terminal screw size  | M3.5   |  |
| Applicable wire size   | 0.75 to 2 mm <sup>2</sup>  |  |
| Applicable tightening torque   | 66 to 89 Ncm   |  |
| External dimensions (HxWxD)<br>[mm]                                    | 98x83x115  |  |
| Weight   | 0.60 kg  | 0.47 kg  |
| Allowable momentary power failure period ④                             | 10 ms  | 20 ms  |

**Tab. 12-69: Redundant power supply module of MELSEC System Q specifications**

- ① When power is switched on again immediately (within 5 seconds) after power-off, an inrush current of more than the specified value (2 ms or less) may flow.  
Reapply power 5 or more seconds after power-off.  
When selecting a fuse and breaker in the external circuit, take account of the blowout, detection characteristics etc.
- ② Overcurrent protection  
The overcurrent protection device shuts off the 5 V, 24 V DC circuit and stops the system if the current flowing in the circuit exceeds the specified value.  
The LED of the power supply module turns off or turns on in dim green when voltage is lowered. If this device is activated, switch the input power supply off and eliminate the cause such as insufficient current capacity or short. Then, a few minutes later, switch it on to restart the system.
- ③ Overvoltage protection  
The overvoltage protection device shuts off the 5 VDC circuit and stops the system if a voltage of 5.5 V DC is applied to the circuit.  
When this device is activated, the power supply module LED turns on in red. If this happens, switch the input power off, then a few minutes later on. This causes the initial start for the system to take place. The power supply module must be changed if the system is not booted and the LED remains red.

- ④ If the momentary power failure time is within the period given in the table above, the system detects an AC down and suspends the operation processing. However, the system continues operations after the power comes back. In the system operating with two redundant power supply modules, the system does not initially start operations when the momentary power failure exceeding 20 ms occurs in only one of the input power supplies. The system, however, may initially start operations when the momentary power failure exceeding 20 ms occurs simultaneously in both input power supplies.

**Q64RP only (AC input power supply):**

Supplying the same amount of AC to both the power supply module and the input module (such as QX10) can prevent the sensor connected to the input module from being switched to the OFF status when the power supply turns off.

Note, however, that if only the input module (such as QX10) is connected on the AC line, which is connected to the power supply, an AC down detection in the power supply module may be delayed due to the internal capacitor of the input module. To avoid this, connect a load of approx. 30 mA per input module on the AC line.

**Q63RP only (DC input power supply):**

The allowable momentary power failure period is the time when 24 V DC is input. If the input is less than 24 V DC, the time will be shorter.)

**Power supplies are integrated into Q00JCPU and Q00UJCPU**

| Item   | Q00JCPU                        | Q00UJCPU   |

# A Appendix

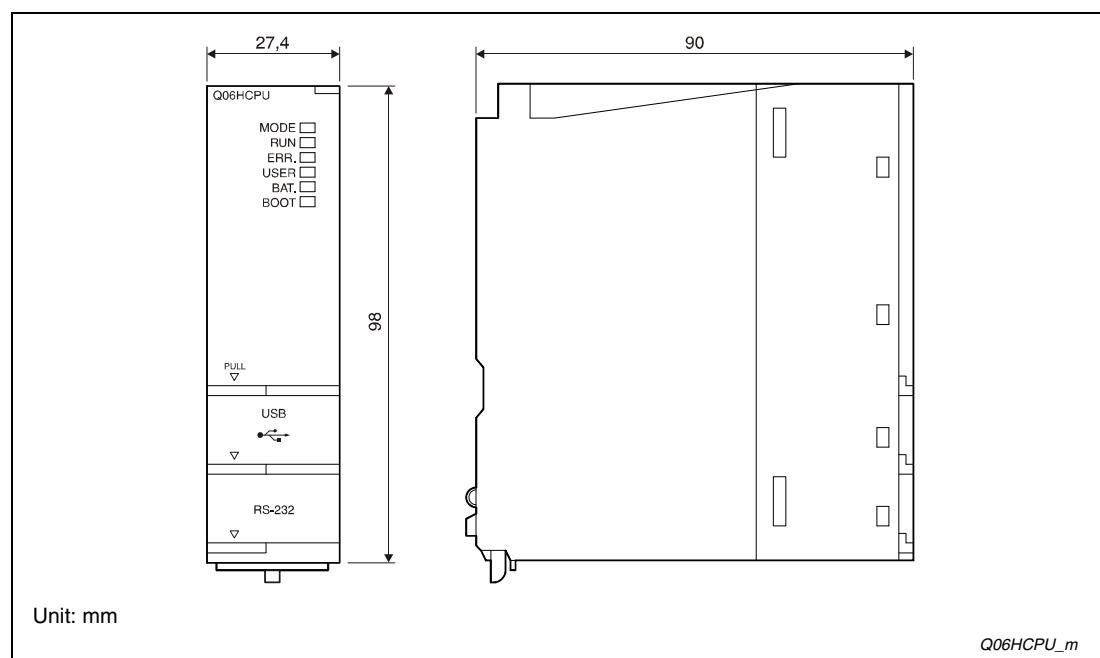

## A.1 External dimensions

### A.1.1 CPU modules

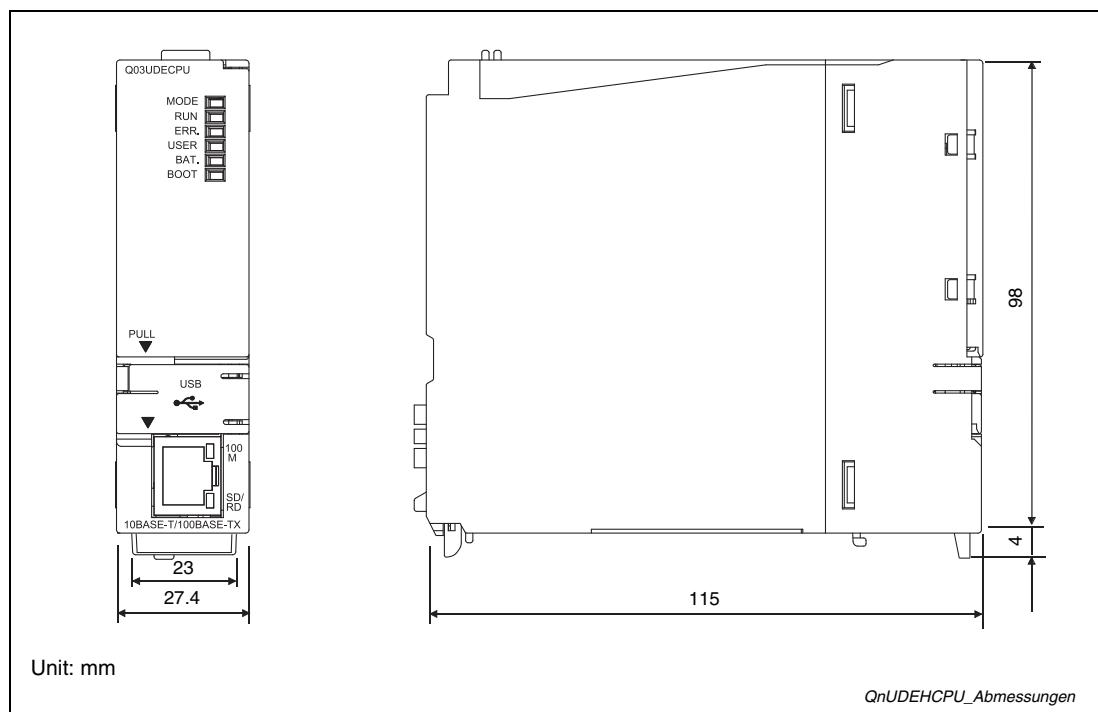

**Q00JCPU and Q00UJCPU**

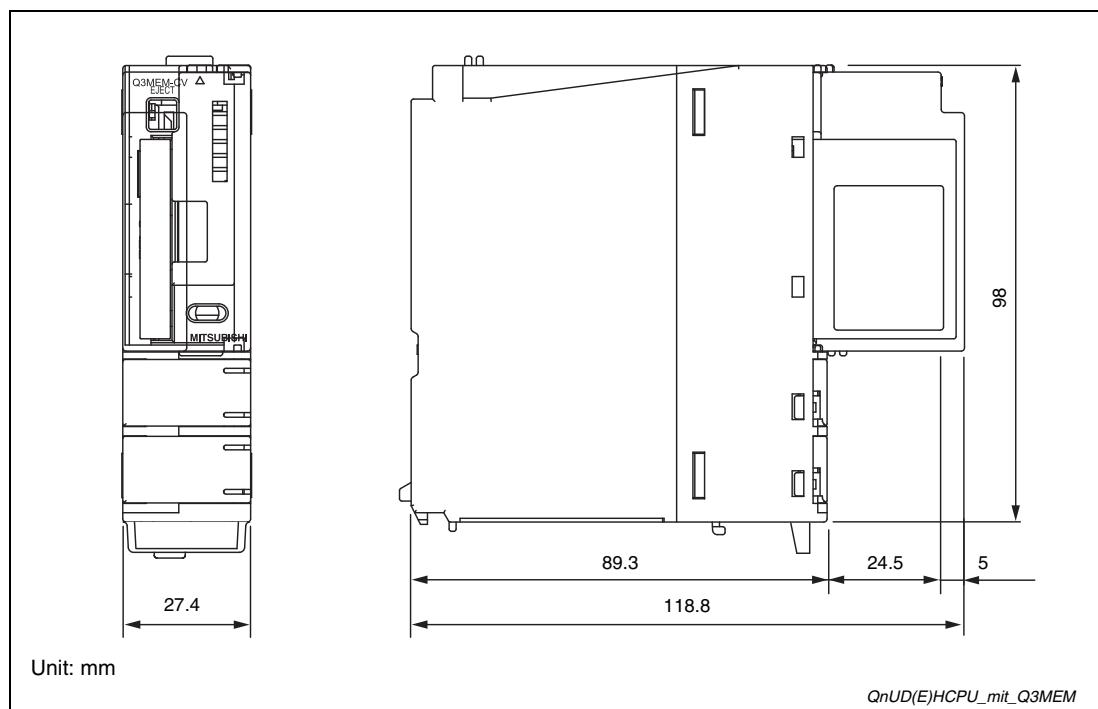

**Q00CPU, Q01CPU, Q02CPU, Q02HCPU, Q06HCPU, Q12HCPU, Q25HCPU,  
Q02PHCPU, Q06PHCPU, Q12PHCPU, Q25PHCPU,  
Q00UCPU, Q01UCPU, Q02UCPU, Q03UDCPU, Q04UDHCPU, Q06UDHCPU, Q10UDHCPU,  
Q13UDHCPU, Q20UDHCPU, Q26UDHCPU**

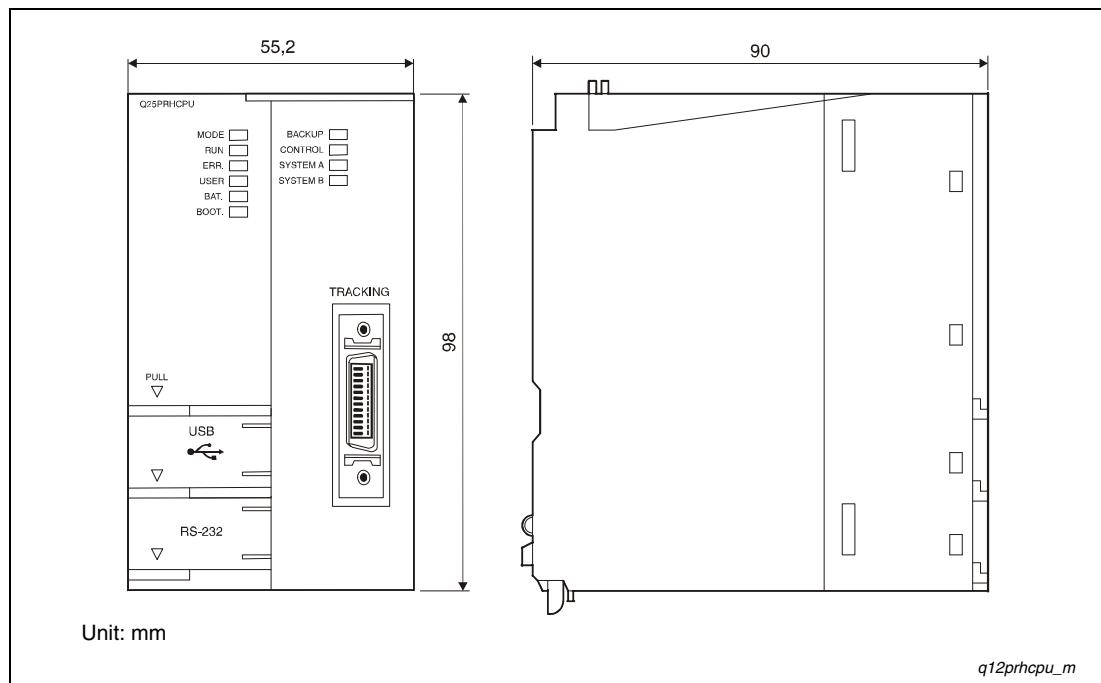

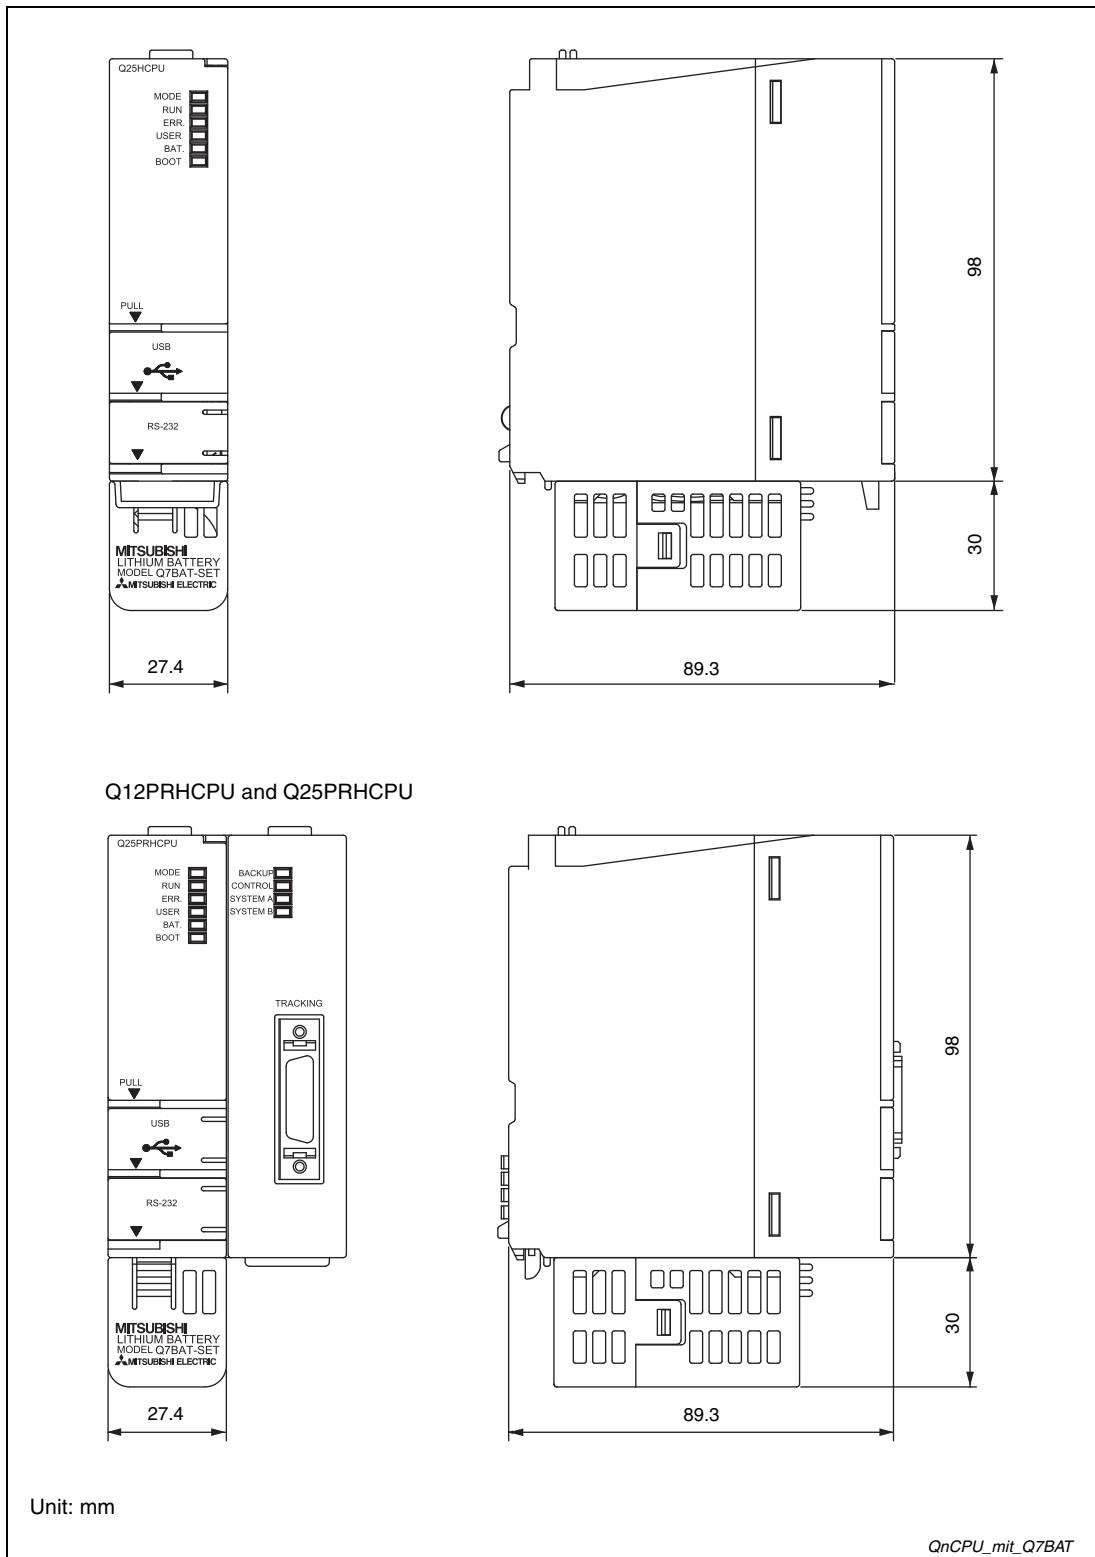

**Q03UDECPU, Q04UDEHCPU, Q06UDEHCPU, Q10UDEHCPU, Q13UDEHCPU,  
Q20UDEHCPU, Q26UDEHCPU**

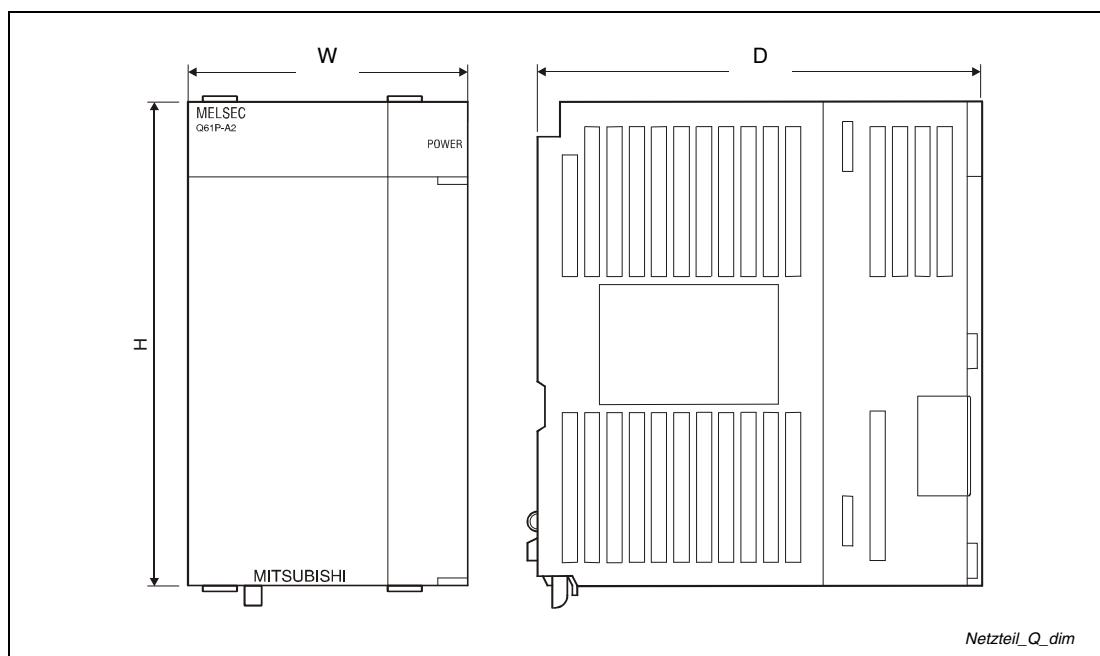

**Q02UCPU, Q03UD(E)CPU, Q04UD(E)HCPU, Q06UD(E)HCPU, Q10UD(E)HCPU,  
Q13UD(E)HCPU, Q20UD(E)HCPU, Q26UD(E)HCPU when battery Q3MEM-4MBS or  
Q3MEM-8MBS is mounted on the CPU module**

**Q12PRHCPU, Q25PRHCPU**

**When Q7BAT-SET is mounted on the CPU module**

### A.1.2 Power supply modules

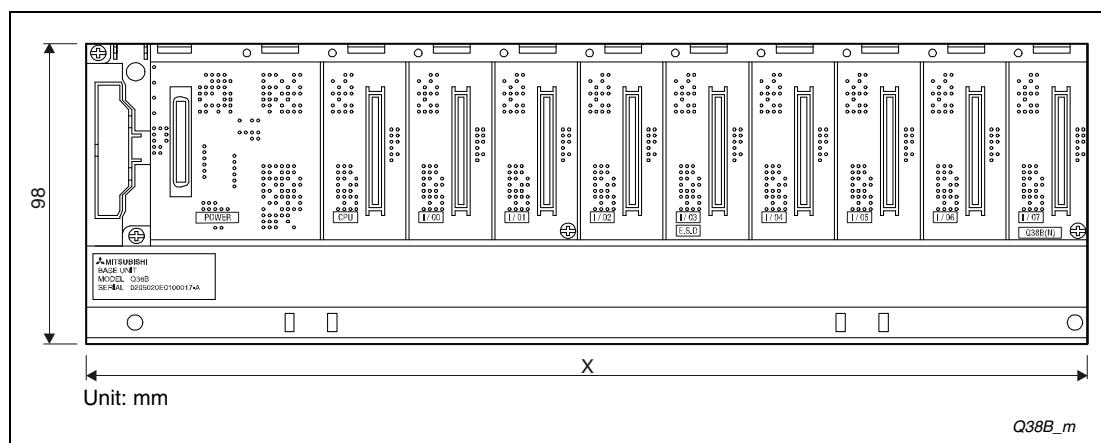

| Power supply module | Width (W) | Height (H)                       | Depth (D) |  |  |
|---------------------|-----------|----------------------------------|-----------|--|--|
| Q61P-A1             | 55.2 mm   | 98 mm                            | 90 mm     |  |  |
| Q61P-A2             |           |                                  |           |  |  |
| Q61P                |           |                                  |           |  |  |
| Q61P-D              |           |                                  |           |  |  |
| Q61SP               | 27.4 mm   | 90 mm<br>(+ 14 mm for terminals) | 90 mm     |  |  |
| Q62P                | 55.2 mm   |                                  |           |  |  |
| Q63P                |           |                                  |           |  |  |
| Q63RP               | 83 mm     | 115 mm                           | 115 mm    |  |  |
| Q64P                | 55.2 mm   |                                  |           |  |  |
| Q64PN               |           |                                  |           |  |  |
| Q64RP               | 83 mm     |                                  |           |  |  |
